Notice

Use of the technologies described in this specification may infringe patents, copyrights or other intellectual property rights of FIPA Members and non-members. Nothing in this specification should be construed as granting permission to use any of the technologies described. Anyone planning to make use of technology covered by the intellectual property rights of others should first obtain permission from the holder(s) of the rights. FIPA strongly encourages anyone implementing any part of this specification to determine first whether part(s) sought to be implemented are covered by the intellectual property of others, and, if so, to obtain appropriate licenses or other permission from the holder(s) of such intellectual property prior to implementation. This specification is subject to change without notice. Neither FIPA nor any of its Members accept any responsibility whatsoever for damages or liability, direct or consequential, which may result from the use of this specification.

Foreword

- 23 The Foundation for Intelligent Physical Agents (FIPA) is an international organization that is dedicated to promoting the
- 24 industry of intelligent agents by openly developing specifications supporting interoperability among agents and agent-
- 25 based applications. This occurs through open collaboration among its member organizations, which are companies
- and universities that are active in the field of agents. FIPA makes the results of its activities available to all interested
- 27 parties and intends to contribute its results to the appropriate formal standards bodies where appropriate.
- 28 The members of FIPA are individually and collectively committed to open competition in the development of agent-
- 29 based applications, services and equipment. Membership in FIPA is open to any corporation and individual firm,
- 30 partnership, governmental body or international organization without restriction. In particular, members are not bound
- 31 to implement or use specific agent-based standards, recommendations and FIPA specifications by virtue of their
- 32 participation in FIPA.
- 33 The FIPA specifications are developed through direct involvement of the FIPA membership. The status of a
- 34 specification can be either Preliminary, Experimental, Standard, Deprecated or Obsolete. More detail about the
- 35 process of specification may be found in the FIPA Procedures for Technical Work Document Policy [f-out-00000] and
- 36 the FIPA Specifications Policy [f-out-00003]. A complete overview of the FIPA specifications and their current status
- 37 may be found in the FIPA List of Specifications on the FIPA Web site. A list of terms and abbreviations used in the
- 38 FIPA specifications may be found in the FIPA Glossary.
- 39 FIPA is a non-profit association registered in Geneva, Switzerland. As of Juneanuary 20020, the 56 members of FIPA
- 40 represented 17 many countries worldwide. Further information about FIPA as an organization, membership
- information, FIPA specifications and upcoming meetings may be found on the FIPA Web site at http://www.fipa.org/-

1 Scope

This document is part of the FIPA specifications covering agent management for inter-operable agents. This specification incorporates and further enhances the FIPA 98 Agent Management Specification [FIPA00002]. The FIPA Agent Message Transport Specification [FIPA00067] represents a companion specification.

This document contains specifications for agent management including agent management services, agent management ontology and agent platform message transport. This document is primarily concerned with defining open standard interfaces for accessing agent management services. The internal design and implementation of intelligent agents and agent management infrastructure is not mandated by FIPA and is outside the scope of this specification.

The document provides a series of examples to illustrate the agent management functions defined.

Agent Management Reference Model

Agent management provides the normative framework within which FIPA agents exist and operate. It establishes the logical reference model for the creation, registration, location, communication, migration and retirement of agents.

The entities contained in the reference model (see Figure 1) are logical capability sets (that is, services) and do not imply any physical configuration. Additionally, the implementation details of individual APs and agents are the design choices of the individual agent system developers.

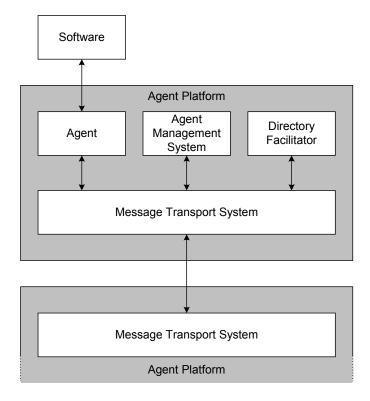

Figure 1: Agent Management Reference Model

The agent management reference model consists of the following logical components¹, each representing a capability set (these can be combined in physical implementations of APs):

- •An agent is a computational process that implements the autonomous, communicating functionality of an application. Agents communicate using an Agent Communication Language. An Agent is the fundamental actor on an AP which combines one or more service capabilities, as published in a service description, into a unified and integrated execution model. An agent must have at least one owner, for example, based on organisational affiliation or human user ownership, and an agent must support at least one notion of identity. This notion of identity is the Agent Identifier (AID) that labels an agent so that it may be distinguished unambiguously within the Agent Universe. An agent may be registered at a number of transport addresses at which it can be contacted. An Agent is the fundamental actor on an AP which combines one or more service capabilities into a unified and integrated execution model that may include access to external software, human users and communications facilities. An agent may have certain resource brokering capabilities for accessing software (see [FIPA00079]).
- An agent must have at least one owner, for example, based on organisational affiliation or human user ownership, and an agent may support several notions of identity. An Agent Identifier (AID) labels an agent so that it may be distinguished unambiguously within the Agent Universe. An agent may be registered at a number of transport

¹ The functionalities of these components are a specialization of the AA notion of Secryice [see FIPA00001].

addresses at which it can be contacted and it may have certain resource brokering capabilities for accessing software.

- A Directory Facilitator (DF) is an optional -mandatory component of the AP, but if it is present, it must be implemented as a DF service (see 4.1, Directory Facilitator). The DF provides yellow pages services to other agents. Agents may register their services with the DF or query the DF to find out what services are offered by other agents. Multiple DFs may exist within an AP and may be federated. The DF is a reification of the Agent <u>Directory Service in [FIPA00001].</u>
- An Agent Management System (AMS) is a mandatory component of the AP. The AMS exerts supervisory control over access to and use of the AP. Only one AMS will exist in a single AP. The AMS maintains a directory of AIDs which contain transport addresses (amongst other things) for agents registered with the AP. The AMS offers white pages services to other agents. Each agent must register with an AMS in order to get a valid AID. The AMS is a reification of the Agent Directory Service in [FIPA00001].
- An Message Transport Service (MTS) is the default communication method between agents on different APs (see [FIPA00067]).
- An Agent Platform (AP) provides the physical infrastructure in which agents can be deployed. The AP consists of the machine(s), operating system, agent support software, FIPA agent management components (DF, AMS and MTS) and agents.

The internal design of an AP is an issue for agent system developers and is not a subject of standardisation within FIPA. AP's and the agents which are native to those APs, either by creation directly within or migration to the AP, may use any proprietary method of inter-communication.

It should be noted that the concept of an AP does not mean that all agents resident on an AP have to be colocated on the same host computer. FIPA envisages a variety of different APs from single processes containing lightweight agent threads, to fully distributed APs built around proprietary or open middleware standards.

FIPA is concerned only with how communication is carried out between agents who are native to the AP and agents outside the AP-or agents who dynamically register with an AP. Agents are free to exchange messages directly by any means that they can support.

Software describes all non-agent, executable collections of instructions accessible through an agent. Agents may access software, for example, to add new services, acquire new communications protocols, acquire new security protocols/algorithms, acquire new negotiation protocols, access tools which support migration, etc.

3 Agent Naming

The FIPA agent naming reference model identifies an agent through an extensible collection of parameter-value pairs², called an Agent Identifier (AID). The extensible nature of an AID allows it to be augmented to accommodate other requirements, such as social names, nick names, roles, etc. which can then be attached to services within the AP. An AID comprises³ (see section 6.1.1, Agent Identifier Description):

- A name. The name parameter, which is a globally unique identifier that can be used as a unique referring expression of the agent. One of the simplest mechanisms is to construct it from the actual name of the agent and its home agent platform address⁴ (HAP), separated by the '@' character. This is a reification of the notion of an Agent Name from [FIPA00001].
- The addresses parameter, which is Other parameters, such as a list of transport addresses where a message can be delivered (see section 3.1, Transport Addresses). This is a reification of the notion of a Locator from [FIPA00001].
- The resolvers parameter, which is a list of, name resolution service addresses (see section 3.2, Name Resolution).

The extensible nature of an AID allows it to be augmented to accommodate other requirements, such as social names, nick names, roles, etc. which can then be attached to services within the AP.

AIDs are primarily intended to be used to identify agents inside the envelope of a message, specifically within the *to and *from parameters (see [FIPA00067]). The definition of the AID object and its parameters is given in section 6.1.1, Agent Identifier Description.

The parameter values of an AID can be edited or modified by an agent, for example, to update the sequence of name resolution servers or transport addresses in an AID. However, the mandatory parameters can only be changed by the agent to whom the AID belongs.

AlDs are primarily intended to be used to identify agents inside the envelope of a transport message, specifically within the to and from parameters (see [FIPA00067]).

Two AIDs are considered to be equivalent if their name parameters are the same.

The :name parameter of an AID is a globally unique identifier that can be used as a unique referring expression of the agent. One of the simplest mechanisms is to construct it from the actual name of the agent and its home agent platform address (HAP), separated by the '@' character.

3.1 Transport Addresses

A transport address is a physical address at which an agent can be contacted and is usually specific to a Message Transport Protocol. A given agent may support many methods of communication and can put multiple transport address values in the ÷addresses parameter of an AID.

The EBNF syntax of a transport addresses is the same as for a URL given in [RFC2396]. [FIPA00067] describes the semantics of message delivery with regard to transport addresses.

² The name of aAdditional parameters added to an AID and not defined by FIPA, must be prefixed with 'x-' to avoid name conflict with any future extension of the standard.

³ The name of an agent is immutable and cannot be changed during the lifetime of the agent; the other parameters in the AID of an agent can be changed.

⁴ The HAP of an agent is the AP on which the agent was created.

^{*}The HAP of an agent is the AP on which the agent was created.

3.2 Name Resolution

 Name resolution is a service that is provided by the AMS through the search function. The *resolvers parameter of the AID contains a sequence of AIDs at which the AID of the agent can ultimately be resolved into a transport address or set of transport address.

An example name resolution pattern might be:

<u>a</u>Agent<u>-a</u>A wishes to send a message to <u>a</u>Agent<u>-b</u>B, whose AID is:

```
(agent-identifier
  :name aAgent_bB@bar.com
  :resolvers (sequence
        (agent-identifier
            :name ams@foo.com
            :addresses (sequence iiop://foo.com/acc))))
```

and agent-a AgentA wishes to know additional transport addresses that have been given for agent-bAgentB.

- 2. Therefore, <u>agent-a AgentA</u>-can send a search request to the first agent specified in the ÷resolvers parameter which is typically an AMS. In this example, the AMS at foo.com.
- 3. If the AMS at foo.com has <u>agent-b AgentB</u>-registered with it, then it returns a result message containing the AMS agent description of <u>agent-b AgentB</u>; if not, then a failed message is returned.
- 4. Upon receipt of the result message, <u>agent-a AgentA</u> can extract the agent-identifier parameter of the ams-agent-description and then extract the ÷addresses parameter of this to determine the transport address(es) of <u>agent-bAgentB</u>.
- 5. <u>agent-a AgentA</u> can now send a message to <u>agent-b AgentB</u> by inserting the ÷addresses parameter into the AID of <u>agent-bAgentB</u>.

4 Agent Management Services

4.1 Directory Facilitator

4.1.1 Overview

A DF is a mandatory-component of an AP_-that provides a yellow pages directory service to agents. It is the trusted, benign custodian of the agent directory. It is trusted in the sense that it must strive to maintain an accurate, complete and timely list of agents. It is benign in the sense that it must provide the most current information about agents in its directory on a non-discriminatory basis to all authorised agents. At least one DF must be resident on each AP (the default DF). However, an AP may support any number of DFs and DFs may register with each other to form federations.

Every agent that wishes to publicise its services to other agents, should find an appropriate DF and request the **registration** of its agent description. There is no intended future commitment or obligation on the part of the registering agent implied in the act of registering. For example, an agent can refuse a request for a service which is advertised through a DF. Additionally, the DF cannot guarantee the validity or accuracy of the information that has been registered with it, neither can it control the life cycle of any agent. An object description must be supplied containing values for all of the mandatory parameters of the description. It may also supply optional and private parameters, containing non-FIPA standardised information that an agent developer might want included in the directory. The **deregistration** function has the consequence that there is no longer a commitment on behalf of the DF to broker information relating to that agent. At any time, and for any reason, the agent may request the DF to **modify** its agent description.

An agent may **search** in order to request information from a DF. The DF does not guarantee the validity of the information provided in response to a search request, since the DF does not place any restrictions on the information that can be registered with it. However, the DF may restrict access to information in its directory and will verify all access permissions for agents which attempt to inform it of agent state changes.

The default DF on an AP has a reserved AID of:

```
(agent-identifier
  :name df@hap_name6
  :addresses (sequence hap_transport_address))
```

4.1.2 Management Functions Supported by the Directory Facilitator

In order to access the directory of agent descriptions managed by the DF, each DF must be able to perform the following functions, when defined on the domain of objects of type df-agent-description in compliance with the semantics described in section 6.1.2, <u>Directory Facilitator Agent Description Directory Facilitator Agent Description</u>:

- register
- deregister
- modify
- search

⁶ The hap name should be replaced with the name of the HAP that is published in the ap-description.

4.1.3 Federated Directory Facilitators

The DF encompasses a search mechanism that searches first locally and then extends the search to other DFs, if allowed. The default search mechanism is assumed to be a depth-first search across DFs. For specific purposes, optional constraints can be used as described in section 6.1.4, <u>Search ConstraintsSearch ConstraintsSearch ConstraintsSearch ConstraintsSearch ConstraintsSearch Constraints</u> such as the number of answers (<u>*df_search_max</u>_results). The federation of DFs for extending searches can be achieved by DFs registering with each other with fipa-df as the value of the ÷type parameter in the service-description.

When a DF receives a search action, it may determine whether it needs to propagate this search to other DFs that are registered with it. It should only forward searches where the value of the max-depth parameter is greater than 1 and where it has not received a prior search with the same search-id parameter. If it does forward the search action, then it must use the following rules:

1. It must not change the value of the search-id parameter when it propagates the search and the value of all search-id parameters should be globally unique.

2. Before propagation, it should decrement the value of the max-depth parameter by 1.

_

⁷ Some DFs may not support federated search, in which case the max-result, max-depth and search-id parameters have no effect.

353 <u>4.2</u>

4.2 Agent Management System

4.2.1 Overview

An AMS is a mandatory component of the AP and only one AMS will exist in a single AP. The AMS is responsible for managing the operation of an AP, such as the creation of agents, the deletion of agents, deciding whether an agent can dynamically register with the AP and overseeing the migration of agents to and from the AP (if agent mobility is supported by the AP). Since different APs have different capabilities, the AMS can be queried to obtain a description of its AP. A life cycle is associated with each agent on the AP (see section 5.1, <u>Agent Life CycleAgent Life C</u>

The AMS represents the managing authority of an AP and if the AP spans multiple machines, then the AMS represents the authority across all machines. An AMS can request that an agent performs a specific management function, such as quit (that is, terminate all execution on its AP) and has the authority to forcibly enforce the function if such a request is ignored.

The AMS maintains an index of all the agents that are currently resident on an AP, which includes the AID of agents. Residency of an agent on the AP implies that the agent has been registered with the AMS. Each agent, in order to comply with the FIPA reference model, must **register** with the AMS of its HAP.—Registration with the AMS, implies authorisation to access the MTS of the AP in order to send or receive messages. The AMS will check the validity of the passed agent description and, in particular, the local uniqueness of the agent name in the AID.

Agent descriptions can be later **modified** at any time and for any reason. Modification is restricted by authorisation of the AMS. The life of an agent with an AP terminates with its **deregistration** from the AMS. After deregistration, the AID of that agent can be removed by the directory and can be made available to other agents who should request it.

Agent description can be **searched** with the AMS and access to the directory of ams-agent-descriptions is further controlled by the AMS; no default policy is specified by this specification.

The AMS is also the custodian of the AP description that can be retrieved by requesting the action get-description.

The AMS on an AP has a reserved AID of:

```
(agent-identifier
  :name ams@hap_name*
  --:addresses (sequence hap_transport_address))
```

The name parameter of the AMS (ams@hap_name) is considered to be the Service Root of the AP (see [FIPA00001]).

4.2.2 Management Functions Supported by the Agent Management System

An AMS must be able to perform the following functions, in compliance with the semantics described in section 6.1.5, Agent Management System Agent DescriptionAgent Management System Agent DescriptionAgent Management System Agent DescriptionAgent Management System Agent Description (the first four functions are defined within the scope of the AMS, only on the domain of objects of type ams-agent-description and the last on the domain of objects of type ap-description):

- register
- deregister
- modify

The hap name should be replaced with the name of the HAP that is published in the ap-description.

- search
- 407 get-description408

In addition to the management functions exchanged between the AMS and agents on the AP, the AMS can instruct the underlying AP to perform the following operations:

· Suspend agent,

Terminate agent,

• Create agent,

Resume agent execution,

Invoke agent,

Execute agent, and,

• Resource management.

- 4.2.3Management Functions Supported by Agents
- 427 Mandatory agent functions:

9 •quit

This function is described in section 6.2.6, Terminate an Agent.

4.3 Message Transport Service

The Message Transport Service (MTS) delivers messages between agents within an AP and to agents that are resident on other APs. All FIPA agents have access to at least one MTS and only messages addressed to an agent can be sent to the MTS. See [FIPA00067] for more information on the MTS.

5.1 **Agent Life Cycle**

FIPA agents exist physically on an AP and utilise the facilities offered by the AP for realising their functionalities. In this context, an agent, as a physical software process, has a physical life cycle that has to be managed by the AP. This section describes a possible life cycle that can be used to describe the states which it is believed are necessary and the responsibilities of the AMS in these states.

The life cycle of a FIPA agent is (see Figure 2):

AP Bounded

An agent is physically managed within an AP and the life cycle of a static agent is therefore always bounded to a specific AP.

Application Independent

The life cycle model is independent from any application system and it defines only the states and the transitions of the agent service in its life cycle.

Instance-Oriented

The agent described in the life cycle model is assumed to be an instance (that is, an agent which has unique name and is executed independently).

Each agent has only one AP life cycle state at any time and within only one AP.

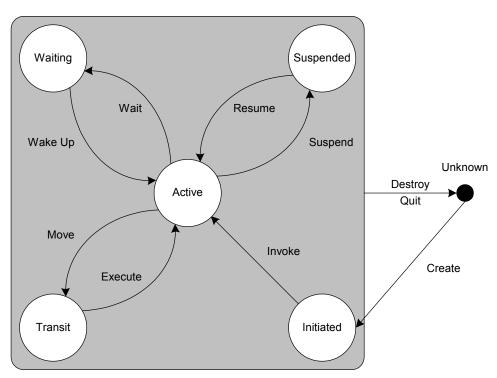

Figure 2: Agent Life Cycle

The followings are the responsibility that an AMS, on behalf of the AP, has with regard to message delivery in each state of the life cycle of an agent:

Active

462 463

464 465

The MTS delivers messages to the agent as normal.

517 518

519

520 521

522 523

Initiated/Waiting/Suspended

The MTS either buffers messages until the agent returns to the active state or forwards messages to a new location (if a forward is set for the agent).

Transit

The MTS either buffers messages until the agent becomes active (that is, the move function failed on the original AP or the agent was successfully started on the destination AP) or forwards messages to a new location (if a forward is set for the agent). Notice that Only mobile agents can enter the Transit state. This ensures that a stationary agent executes all of its instructions on the node where it was invoked.

Unknown

The MTS either buffers messages or rejects them, depending upon the policy of the MTS and the transport requirements of the message.

The state transitions of agents can be described as:

Create

The creation or installation of a new agent.

Invoke

The invocation of a new agent.

Destrov

The forceful termination of an agent. This can only be initiated by the AMS and cannot be ignored by the agent.

Quit

The graceful termination of an agent. This can be ignored by the agent.

Suspend

Puts an agent in a suspended state. This can be initiated by the agent or the AMS.

Resume

Brings the agent from a suspended state. This can only be initiated by the AMS.

Puts an agent in a waiting state. This can only be initiated by an agent.

Wake Up Brings the agent from a waiting state. This can only be initiated by the AMS.

The following two transitions are only used by mobile agents (see [FIPA00005]):

Move Puts the agent in a transitory state. This can only be initiated by the agent.

Execute Brings the agent from a transitory state. This can only be initiated by the AMS.

5.2 Agent Registration

There are three ways in which an agent can be registered with an AMS:

- 524 525
- 527
- 528 529 530
- 531 532 533 534 535
- 536 537 538 539
- 540 541 542 543 544 545 546 547 548 549
- 550 551 552 553 554 555 556 557 558
- 559 560 561 562 563 564 565
- 567 568 569

571 572 573

574

570

- 575 576
- 577 578
- 579

- 526
 - The agent explicitly registered with the AP, assuming that the AP both supports dynamic registration and is willing to register the new agent. Dynamic registration is where an agent which has a HAP wishes to register on another AP as a local agent.
 - Agent registration involves registering an AID with the AMS. When an agent is either created or dynamically registers with an AP, the agent is registered with the AMS, for example by using the register function. In the following example, an agent called *discovery-agent* is registering dynamically with an AP located at foo.com. The agent discovery-agent was created on the AP (that is, discovery-agent's HAP) at bar.com and requests that the AMS registers it.

The agent migrated to the AP, for those APs which support agent mobility (see [FIPA00005]).

For example:

```
(request
  :sender
    (agent-identifier
      :name discovery-agent@bar.com
      :addresses (sequence iiop://bar.com/acc))
  :receiver (set
    (agent-identifier
      :name ams@foo.com
      :addresses (sequence iiop://foo.com/acc)))
  :ontology FIPA-Agent-Managementfipa-agent-management
  :language fipaFIPA-slSL0
  :protocol fipaFIPA-rRequest
  :content
    <u>"(</u>(action
      (agent-identifier
        :name ams@foo.com
        :addresses (sequence iiop://foo.com/acc))
      (register
        (:ams-description
          :name
            (agent-identifier
              :name discovery-agent@bar.com
              :addresses (sequence iiop://bar.com/acc))
            . . . ) ) ) " )
```

It should be noted that the \(\diagrapha\)addresses parameter of the AID represents the transport address(es) that the agent would like any messages directed to (see [FIPA00067] for information on how the MTS deals with this). In the above example, the agent discovery-agent registers itself with the foo.com AP but by virtue of specifying a different transport address in the ÷addresses parameter of its AID, messages that arrive at foo.com will be forwarded to bar.com.

5.2.1 Registration Lease Times

To enable the DF to manage a maintainable number of registrations over a long period of time, the DF can may implement lease times using the lease-time parameter of a df-agent-description. A lease time is either a duration of time, such as 3 hours, or an absolute time, such as 08:00 26-Jul-2002, at which point a registration made by an agent can be removed from the DF registration database.

When an agent wishes to register with a DF, it can specify a lease time which is how long it would like the registration to be kept. If this lease time is okay for the DF, then it will accept the registration as usual and the value of the leasetime parameter in the content of the inform reply will be the same. Consequently, when the lease time expires, the registration will be silently removed by the DF. On the other hand, if the lease time is not acceptable to the DF, then

⁶ If the DF does not support lease times, then it will ignore this parameter.

583 584

585 586

625

626

627 628

629

630 631

632

633 634

635 636

the DF can include a new lease time as the value of the lease-time parameter in the content of the inform reply.

This is the case when an agent does not specify a lease time in its registration.

If the DF does not support lease times, it will notify to the requesting agent that its registration is valid for an unlimited time by removing this parameter in the content of the inform reply, in fact the default lease-time is defined to be unlimited.

For example, and agent may register the following df-agent-description:

```
588
      (request
589
590
        :content
591
          "((action
592
            (agent-identifier
593
               :name df@foo.com
594
               :addresses (sequence iiop://foo.com/acc))
595
            (register
596
               (df-agent-description
597
                :name
598
                  (agent-identifier
599
                    :name dummy@foo.com
                    :addresses (sequence iiop://foo.com/acc))
600
                :protocols fipa-request
601
602
                :ontologies (set fipa-agent-management)
603
                :languages (set fipa-sl0)
604
                :lease-time +00000000T600000000T
605
                . . . " )
```

Then if the DF agrees to this lease time, it will reply with and inform which contains the same value for the lease-time parameter:

```
(inform
 . . .
  :content
    "((done
      (action
        (agent-identifier
          :name df@foo.com
          :addresses (sequence iiop://foo.com/acc))
      <u>(register</u>
        (df-agent-description
          :name
            (agent-identifier
               :name dummy@foo.com
               :addresses (sequence iiop://foo.com/acc))
          :protocols (set fipa-request application-protocol)
          :ontologies (set meeting-scheduler)
          :languages (set fipa-sl0 kif)
          :lease-time +00000000T600000000T
          . . . " )
```

If an agent wishes to renew a lease time, then it can use the modify action to specify a new value for the lease-time parameter. The verification of this lease time goes through the same procedure mentioned in the last paragraph: if it is okay, then the value of the lease-time parameter in the content of the inform reply will be the same, if it is not okay, the value of the lease-time parameter in the content of the inform reply will be a new value which is acceptable to the DF.

6 Agent Management Ontology

6.1 Object Descriptions

This section describes a set of frames, that represent the classes of objects in the domain of discourse within the framework of the FIPA-Agent-Managementfipa-agent-management ontology. The closure of symbols of this ontology can be obtained through the companion document [FIPA00067] that specifies additional set of frames of this ontology.

This ontology does not specify any specific positional order to encode the parameters of the objects, therefore it is required to encode objects in SL by specifying both the parameter name and the parameter value (see section 3.6 of [FIPA00008])

The following terms are used to describe the objects of the domain:

- Frame. This is the mandatory name of this entity, that must be used to represent each instance of this class.
- Ontology. This is the name of the ontology, whose domain of discourse includes the parameters described in the table.
- Parameter. This is the mandatory name of a parameter of this frame.
- **Description**. This is a natural language description of the semantics of each parameter.
- Presence. This indicates whether each parameter is mandatory or optional.
- Type. This is the type of the values of the parameter: Integer, Word, String, URL, Term, Set or Sequence.
- Reserved Values. This is a list of FIPA-defined constants that can assume values for this parameter.

6.1.1 Agent Identifier Description

This type of object represents the identification of the agent. The addresses parameter and the name resolution mechanism (see section 3.2, Name Resolution), is a reification of the notion of Locator from [FIPA00001]. See also section 3.3.7 "Handling Multiple Transport Addresses for a Single Receiver" in FIPA Agent Message Transport Service [FIPA00067] specifications.

Frame Ontology	agent-identifier FIPA-Agent- Managementfipa-agent- management			
Parameter	Description	Presence	Туре	Reserved Values
name	The symbolic name of the agent.	Mandatory	<u>w</u> ₩ord	df@hap <u>name</u> ams@hap <u>name</u>
addresses	A sequence of ordered transport addresses where the agent can be contacted. The order implies a preference relation of the agent to receive messages over that address.	Optional	Sequence of URLurl	
resolvers	A sequence of ordered AIDs where name resolution services for the agent can be contacted. The order in the sequence implies a preference in the list of resolvers.	Optional	Sequence of agent- identifier	

671

672 673

674

675

676

677

678 679

6.1.2 **Directory Facilitator Agent Description**

This type of object represents the description that can be registered with the DF vellow page service. This is a reification of the Agent Directory Entry from [FIPA00001].

Frame Ontology	df-agent-description FIPA Agent Managementfipa-agent- management			
Parameter	Description	Presence	Туре	Reserved Values
name	The identifier of the agent.	Optional	agent-identifier ¹⁰	
services	A list of services supported by this agent.	Optional	Set of service-description	
protocol <u>s</u>	A list of interaction protocols supported by the agent.	Optional	Set of <u>s</u> string	See [FIPA00025]
ontolog <u>ies</u> Y	A list of ontologies known by the agent.	Optional	Set of <u>s</u> String	FIPA-Agent- Managementfipa- agent-management
language <u>s</u>	A list of content languages known by the agent.	Optional	Set of <u>s</u> string	fipaFIPA-SLsl fipaFIPA-slSL0 fipaFIPA-slSL1 FIPAfipa-slSL2
<u>lease-time</u>	The duration or time at which the lease for this registration will expire 11.	Optional	DateTime ¹²	

Service Description 6.1.3

This type of object represents the description of each service registered with the DF.

Frame Ontology	service-description FIPA Agent Management fipa-agent management			
Parameter	Description	Presence	Туре	Reserved Values
name	The name of the service.	Optional	<u>s</u> £tring	
type	The type of the service.	Optional	<u>s</u> String	fipa-df ¹³ fipa-ams
protocol <u>s</u>	A list of interaction protocols supported by the service.	Optional	Set of <u>s</u> String	
ontolog <u>ies</u> Y	A list of ontologies supported by the service.	Optional	Set of <u>s</u> string	FIPA Agent Managementfipa- agent-management
language <u>s</u>	A list of content languages supported by the service.	Optional	Set of <u>s</u> String	
ownership	The owner of the service	Optional	<u>s</u> £tring	
properties	A list of properties that discriminate the service.	Optional	Set of property	

¹⁰ A valid df-agent-description must contain at least one AID to comply with the minimum constraints of an Agent Directory Entry from [FIPA00001], except when searching, when no AID need be present.

The default value for a lease time is assumed to be unlimited.

¹² It is recommended that the value of the lease-time parameter is specified as time duration rather than in absolute time, unless it can be guaranteed that the clocks between the sender and the DF are synchronised.

These reserved values denote agents that provide the DF or AMS services as defined section 4, Agent Management Services.

6.1.4 Search Constraints

679

680

681

682

683

684

685

686

687

688

This type of object represents a set of constraints to limit the function of searching within a directory.

Frame Ontology	search-constraints FIPA Agent Managementfipa-agent- management			
Parameter	Description	Presence	Туре	Reserved Values
max-depth	The maximum depth of propagation of the search to federated directories 14. This value should not be negative. A negative value indicates that the sender agent is willing to allow the search to propagate across all DFs.	Optional	<u>i</u> ±nteger	
max- results	The maximum number of results to return for the search 15. This value should not be negative. A negative value indicates that the sender agent is willing to receive all available results.	Optional	<u>i</u> Integer	
search-id	A globally unique identifier for a search.	<u>Optional</u>	string	

6.1.5 Agent Management System Agent Description

This type of object represents the description of each service registered with the AMSThis type of object represents the agent descriptions treated by an AMS agent. This is a reification of the Agent Directory Entry from [FIPA00001].

Frame Ontology	ams-agent-description FIPA-Agent- Managementfipa-agent- management			
Parameter	Description	Presence	Туре	Reserved Values
name	The identifier of the agent.	Optional	agent-identifier ¹⁶	
ownership	The owner of the agent.	Optional	<u>s</u> String	
state	The life cycle state of the agent.	Optional	<u>s</u> String	initiated active suspended waiting transit

	service.			

6.1.8 Property Template

This is a special object that is useful for specifying parameter/value pairs.

Frame Ontology	property FIPA-Agent- Managementfipa-agent- management			
Parameter	Description	Presence	Туре	Reserved Values
i arameter	Description	i reserice	iyp c	Nescived values
name	The name of the property.	Mandatory	<u>s</u> String	Reserved values

6.2 Function Descriptions

The following tables define usage and semantics of the functions that are part of the <u>FIPA Agent</u> <u>Management fipa-agent-management</u> ontology and that are supported by the agent management services and agents on the AP.

This ontology does not specify any specific name for the arguments of the functions, while their positional order is specified, therefore it is required to encode functions in SL by using the position-dependent form (see section 3.6 of IFIPA00008]).

The following terms are used to describe the functions of the FIPA Agent Management fipa-agent-management domain:

• **Function**. This is the symbol that identifies the function in the ontology.

• **Ontology**. This is the name of the ontology, whose domain of discourse includes the function described in the table.

Supported by. This is the type of agent that supports this function.

Description. This is a natural language description of the semantics of the function.

 • **Domain**. This indicates the domain over which the function is defined. The arguments passed to the function must belong to the set identified by the domain.

• Range. This indicates the range to which the function maps the symbols of the domain. The result of the function is a symbol belonging to the set identified by the range.

 Arity. This indicates the number of arguments that a function takes. If a function can take an arbitrary number of arguments, then its arity is undefined.

6.2.1 Registration of an Object with an Agent

725

Function	register	
Ontology	FIPA-Agent-

Range	Set of objects. In particular, a segent-descriptions (for the	t of df-agent-descriptions (for the DF) and a set of ams-AMS).
Arity	2	

6.2.4.1 Matching Criterion

The search action defined in this ontology mandates the implementation of the following matching criterion in order to determine the set of objects that satisfy the search criteria.

 $^{^{17}}$ Where \times is Cartesian product.

 The first thing to note about the matching operation is that the search action receives, as its first argument, an object description that evaluates to a structured object that will be used as an object template during the execution of the search action. In the following explanation, the expressions parameter template and value template are used to denote a parameter of the object template, and the value of the parameter of the object template, respectively.

A registered object matches an object template if:

- 1. The class name of the object (that is, the object type) is the same as the class name of the object description template, and,
- 2. Each parameter of the object template is matched by a parameter of the object description.

A parameter matches a parameter template if the parameter name is the same as the template parameter name, and its value matches the value template.

Since the value of a parameter is a term, the rules for a term to match another term template must be given. Before, it must be acknowledged that the values of the parameters of descriptions kept by the AMS or by the DF can only be either a cstconstants, sstsets, sstsequences (see [FIPA00008]) or other object descriptions (for example, a service-description).

The search action evaluates functional expressions before the object template is matched against the descriptions kept by the AMS or by the DF. This means that if the value of a parameter of an object description is a functional term (for example, (, (plus 2 3)), then what is seen by the matching process is the result of evaluating the functional term within the context of the receiving agent. A constant matches a constant template if they are equal.

Informally, a sequence matches a sequence template if the elements of the sequence template are matched by elements of the sequence appearing in the same order. Formally, the following recursive rules apply:

- 1. An empty sequence matches an empty sequence, and,
- 2. The sequence $(\cos x \ sequence 1)^{18}$ matches the sequence template $(\cos y \ sequence 2)$ if:
 - x matches y and sequence 1 matches sequence 2, or,
 - sequence1 matches (cons y sequence2).

Finally, a set matches a set template if each element of the set template is matched by an element of the set template. Notice that it is possible that the same element of the set matches more than one element of the set template.

6.2.4.2 Matching Example

The following DF agent description:

```
(df-agent-description
   :name
    (agent-identifier
        :name cdamerapProxyl@foo.com
        :addresses (sequence iiop://foo.com/acc))
   :services (set
    (service-description
        :name description-delivery-1
        :type description-delivery
        :ontologiesy (set tTraffic-sSurveillance-dDomain)
        :properties (set
```

¹⁸ cons is the usual LISP function that it is here used to describe the semantics of the process. The function (which must not be considered part of the FIPA Agent Management fipa-agent management ontology) takes two arguments, the second of which must be a list. It returns a list where the first argument has been inserted as the first element of its second argument. Example: (cons x (sequence y z)) evaluates to (sequence x y z).

```
791
                 (property
792
                   :name camera-id
793
                   :value camera1)
794
                 (property
795
                   :name baud-rate
796
                   :value 1MHz)))
797
            (service-description
798
              :name agent-feedback-information-1
799
              :type agent-feedback-information
              :ontologiesy (set traffic-surveillance-domain)
800
801
              :properties (set
802
                 (property
803
                   :name camera-id
804
                   :value camera1))))
         :protocols (set FIPAfipa-rRequest FIPAfipa-qQuery)
805
806
         :ontologies<del>y</del>
                                  tTraffic-sSurveillance-dDomain
                            (set
807
       management)
808
         : languages (set FIPAfipa-slSL))
809
810
       will match the following DF agent description template:
811
812
       (df-agent-description
813
         :services (set
814
            (service-description
815
              :type description-delivery
816
              : ontolog_{\underline{iesy}} \text{ (set } \underline{t}\underline{T}raffic-\underline{s}\underline{S}urveillance-\underline{d}\underline{D}omain)
817
              :properties (set
818
                 (property
```

Notice that several parameters of the df-agent-description were omitted in the df-agent-description template. Furthermore, not all elements of set-valued parameters of the df-agent-description were specified and, when the elements of a set were themselves descriptions, the corresponding object description templates are also partial descriptions.

Arity	4	

6.3 Exceptions

The normal pattern of interactions between application agents and management agents follow the form of the FIPAfipa-request interaction protocol (see [FIPA00026]). Under some circumstances, an exception can be generated, for example, when an AID that has been already registered is re-registered. These exceptions are represented as propositions that evaluate to true under the exceptional circumstances. This section describes the standard set of predicates (defined over a set of arguments) and propositional symbols in the domain of discourse of the fipa-agent-management ontology. These exceptions are represented as predicates that become true. This section describes all the predicates of the domain of discourse of the FIPA-Agent-Management-ontology that represent exceptions of the interactions.

6.3.1 Exception Selection

The following rules are adopted to select the appropriate communicative act that will be returned in when a management action causes an exception:

- If the communicative act is not understood by the receiving agent, then the replied communicative act is not-understood.
- If the requested action is not supported by the receiving agent, then the communicative act is refuse.
- If the requested action is supported by the receiving agent but the sending agent is not authorised to request the function, then the communicative act is refuse.
- If the requested function is supported by the receiving agent and the client agent is authorised to request the function but the function is syntactically or semantically ill-specified, then the communicative act is refuse.
- In all the other cases the receiving agent sends to the sending agent a communicative act of type agree. Subsequently if any condition arises that prevents the receiving agent from successfully completing the requested function, then the communicative act is failure.

6.3.2 Exception Classes

There are four main classes or exceptions that can be generated in response to a management action request:

- unsupported: The communicative act and the content has been understood by the receiving agent, but it is not supported.
- unrecognised: The content has not been understood by the receiving agent.
- unexpected: The content has been understood by the receiving agent, but it includes something that was unexpected.
- missing: The content has been understood by the receiving agent, but something that was expected is missing.

6.3.3 Not Understood Exception Predicates

Communicative Act Ontology	not-understood FIPA Agent Managementfipa-agent- management	
Predicate Symbol	Arguments	Description
unsupported-act	<u>s</u> £tring	The receiving agent does not support the specific communicative act; the string identifies the unsupported communicative act.

unexpected-act	<u>s</u> String	The receiving agent supports the specified communicative act, but it is out of context; the string identifies the unexpected communicative act.
unsupported-value	<u>s</u> String	The receiving agent does not support the value of a message parameter; the string identifies the message parameter name.
unrecognised-value	<u>s</u> String	The receiving agent cannot recognise the value of a message parameter; the string identifies the message parameter name.

6.3.4Refusal Exception Propositions

875

876

877

878 879

Communicative Act Ontology	refuse FIPA Agent Managementfipa-agent- management	
Predicate symbol	Arguments	Description
unauthorised		The sending agent is not authorised to perform the function.
unsupported-function	<u>s</u> string	The receiving agent does not support the function; the string identifies the unsupported function name.
missing-argument	<u>s</u> String	A mandatory function argument is missing; the string identifies the missing function argument name.
unexpected-argument	<u>s</u> String	A mandatory function argument is present which is not required; the string identifies the unrequired function argument.
unexpected-argument-count		The number of function arguments is incorrect.
missing-parameter	<u>s</u> String <u>s</u> String	A mandatory parameter is missing; the first string represents the object name and the second string represents the missing parameter name.
unexpected-parameter	<u>s</u> String <u>s</u> String	The receiving agent does not support the parameter; the first string represents the function name and the second string represents the unsupported parameter name.
unrecognised-parameter- value	<u>s</u> string <u>s</u> string	The receiving agent cannot recognise the value of a parameter; the first string represents the object name and the second string represents the parameter name of the unrecognised parameter value.

<u>6.3.56.3.4</u> Failure Exception Propositions

Communicative Act Ontology	failure FIPA Agent Managementfipa-agent- management	
Predicate symbol	Arguments	Description
already-registered		The sending agent is already registered with the receiving agent.
not-registered		The sending agent is not registered with the receiving agent.
internal-error	<u>s</u> String	An internal error occurred; the string identifies the internal error.

7 Agent Management Content Language

Agent Management uses FIPA-SLfipa-sl0 as a content language which is defined in [FIPA00008].

9 Informative Annex A — Dialogue Examples

1. The agent *dummy* is created and it registers with the AMS of its home AP:

```
(request
 :sender
   (agent-identifier
      :name dummy@foo.com
      :addresses (sequence iiop://foo.com/acc))
 :receiver (set
   (agent-identifier
      :name ams@foo.com
      :addresses (sequence iiop://foo.com/acc)))
 :language fipaFIPA-SLs10
 :protocol fipaFIPA-rRequest
 :ontology fipaFIPA-aAgent-mManagement
 :content
   "((action
      (agent-identifier
        :name ams@foo.com
        :addresses (sequence iiop://foo.com/acc))
      (register
        (ams-agent-description
          :name
            (agent-identifier
              :name dummy@foo.com
              :addresses (sequence iiop://foo.com/acc))
          :state active)))")
```

2. The AMS agrees and then informs *dummy* of the successful execution of the action:

```
(agree
  :sender
    (agent-identifier
      :name ams@foo.com
      :addresses (sequence iiop://foo.com/acc))
  :receiver (set
    (agent-identifier
      :name dummy@foo.com
      :addresses (sequence iiop://foo.com/acc)))
  :language <u>fipaFIPA</u>-SLsl0
  :protocol fipaFIPA-rRequest
  :ontology FIPAfipa-aAgent-mManagement
  :content
    <u>"</u>((action
      (agent-identifier
        :name ams@foo.com
        :addresses (sequence iiop://foo.com/acc))
      (register
        (ams-agent-description
          :name
            (agent-identifier
              :name dummy@foo.com
              :addresses (sequence iiop://foo.com/acc))
          :state active)))
    true)")
(inform
  :sender
    (agent-identifier
      :name ams@foo.com
      :addresses (sequence iiop://foo.com/acc))
  :receiver (set
    (agent-identifier
```

10 Informative Annex B — ChangeLog

10.1 2001/10/03 - version H by FIPA Architecture Board

Page 24, line 825: Changed incorrect reference from AMS to DF.

1333	10.2.2002/0705/261	9 - version I by FIPA Architecture Board
1334 1335	Entire specification: Entire specification:	Removed all leading colons (:) from parameter names.
1336	Entire specification:	Changed all ontology terms to lowercase. Various typo changes to all examples.
1337	Entire specification:	Changed references of hap to hap name.
1338	Entire specification:	Fixed syntax of the examples by adding extra parenthesis in the content
1339		
1340	Page 2, line 105:	Added a footnote linking agent management services to the Abstract Architecture notion of
1341	Page 2x lines 109 116y:	Service.
1341	Page 2x, lines 108-116y:	
1342	Page 2, line 118:	Removed the requirement that the DF is a mandatory component of the AP.
	Page 2, line 120:	Added a link between the DF and the Agent Directory Service from [FIPA00001].
1344	Page 3, line 125:	Added a link between the AMS and the Agent Directory Service from [FIPA00001].
1345	Page 3, line 143:	Removed obsolete reference to dynamic registration.
1346	Page 4, line 151:	Restructured section on Agent Naming to list all components of an AID and cross-reference
1347	Dogg 4 line 470:	with equivalents in [FIPA00001].
1348	Page 4, line 173:	Added a sentence describing AID equivalence.
1349	Page 6, line 215:	Removed the requirement that the DF is a mandatory component of the AP.
1350	Page 6, line 260:	Changed incorrect reference to df-search-result to max-results.
1351	Page 6, line 261:	Added text on limiting the propagation of federated searches
1352	Page 7, lines 265-266:	Removed obsolete reference to dynamic registration.
1353	Page 7, lines 278-280:	Removed sentences describing the requirements that the AMS must check all MTS
1354	David 7 11 - 007	message sends and receives.
1355	Page 7, line 297:	Added a link between the name parameter of the AMS and the Service Root from
1356	Danis 0 II. 2004	[FIPA00001].
1357	Page 8, line 331:	Removed section on Mandatory Functions Supported by Agents (specifically quit).
1357 1358	Page 9, line 345:	Removed section on Mandatory Functions Supported by Agents (specifically quit). Added an explanatory sentence to the agent life cycle description.
1357 1358 1359	Page 9, line 345: Page 10, lines 414, 427:	Removed section on Mandatory Functions Supported by Agents (specifically quit). Added an explanatory sentence to the agent life cycle description. Removed incorrect reference to [FIPA00005].
1357 1358 1359 1360	Page 9, line 345: Page 10, lines 414, 427: Page 11, lines 429-431:	Removed section on Mandatory Functions Supported by Agents (specifically quit). Added an explanatory sentence to the agent life cycle description. Removed incorrect reference to [FIPA00005]. Removed obsolete reference to dynamic registration.
1357 1358 1359 1360 1361	Page 9, line 345: Page 10, lines 414, 427: Page 11, lines 429-431: Page 11, lines 433-435:	Removed section on Mandatory Functions Supported by Agents (specifically quit). Added an explanatory sentence to the agent life cycle description. Removed incorrect reference to [FIPA00005]. Removed obsolete reference to dynamic registration. Removed obsolete references to dynamic registration.

Added a new parameter, lease-time, to the df-agent-description. Added a footnote explaining the suggested value of lease-time as a time duration. Added a note that references [FIPA00067] for the closure of-fipa-agent-management
1357 1358 1359 1360 1361 1362 1363 1364 1365 1366 1367 1368 1369 1370 1371 1372 1373 1374	Page 9, line 345: Page 10, lines 414, 427: Page 11, lines 429-431: Page 11, lines 433-435: Page 11, line 469: Page 12, line 472: Page 13, line 498:	Removed section on Mandatory Functions Supported by Agents (specifically quit). Added an explanatory sentence to the agent life cycle description. Removed incorrect reference to [FIPA00005]. Removed obsolete reference to dynamic registration. Removed obsolete references to dynamic registration. Added a section explaining registration lease times Added a note that references [FIPA00067] for the closure of fipa-agent-management ontology Modified the names of the following parameters: protocols, ontologies, languages Added a link between the addresses parameter and the Locator from [FIPA00001]. Added a link between the df-agent-description and the Agent Directory Entry from [FIPA00001]. Added a footnote requiring at least one AID to be present, except when searching. Added a new parameter, lease-time, to the df-agent-description. Added a footnote explaining the suggested value of lease-time as a time duration. Added a note that references [FIPA00067] for the closure of fipa-agent-management entology
1357 1358 1359 1360 1361 1362 1363 1364 1365 1366 1367 1368 1369 1370 1371 1372 1373 1374 1375	Page 9, line 345: Page 10, lines 414, 427: Page 11, lines 429-431: Page 11, lines 433-435: Page 11, line 469: Page 12, line 472: Page 13, line 498: Page 13, line 556 558 Page 13, line 566:	Removed section on Mandatory Functions Supported by Agents (specifically quit). Added an explanatory sentence to the agent life cycle description. Removed incorrect reference to [FIPA00005]. Removed obsolete reference to dynamic registration. Removed obsolete references to dynamic registration. Added a section explaining registration lease times Added a note that references [FIPA00067] for the closure of fipa-agent-management ontology Modified the names of the following parameters: protocols, ontologies, languages Added a link between the addresses parameter and the Locator from [FIPA00001]. Added a link between the df-agent-description and the Agent Directory Entry from [FIPA00001]. Added a footnote requiring at least one AID to be present, except when searching. Added a new parameter, lease-time, to the df-agent-description. Added a footnote explaining the suggested value of lease-time as a time duration. Added a note that references [FIPA00067] for the closure of fipa-agent-management ontology Added a reference to section 3.3.6 of FIPA00067.

Added a note on negative values for max-depth and max-results. Added a search-id parameter to search-constraints.

Removed mobility parameter from ap-description.

1382	Page 14, line 512:	Removed dynamic parameter from ap-description.
1383	Page 14, line 512:	Changed name of transport-profile parameter to ap-services. Changed type to
1384		a set of ap-services.
1385	Page 14, line 633:	Added note on how to encode objects in SL.
1386	Page 14, line 585,587:	Modified the names of the following parameters: protocols, ontologies, languages
1387	Page 15, line 514:	Added new section 6.1.7 on Agent Service Description (apAP-sservice).
1388	Page 17, line 588:	Removed the incorrect word 'template' at the end of the sentence.
1389	Page 17, line 609:	Changed 1MHZ to 1 in example.
1390	Page 18, line 642:	Removed guit function.
1391	Page 18, lines 647-649:	Changed the exception model from predicates which return true to propositions that
1392		evaluate to true.
1393	Page 18, line 691:	Added note on how to encode functions in SL.
1394	Page 19, line 629:	Modified object-description-template into ams-agent-description/df-agent-description
1395	Page 294, line 1110 72 :	Removed wrong parenthesis in the example
1387 1388 1389 1390 1391 1392 1393 1394	Page 15, line 514: Page 17, line 588: Page 17, line 609: Page 18, line 642: Page 18, lines 647-649: Page 18, line 691: Page 19, line 629:	Removed the incorrect word 'template' at the end of the sentence. Changed 1MHZ to 1 in example. Removed quit function. Changed the exception model from predicates which return true to propositions to evaluate to true. Added note on how to encode functions in SL. Modified object-description-template into ams-agent-description/df-agent-description
