FOUNDATION FOR INTELLIGENT PHYSICAL AGENTS

FIPA 97 Specification, Version 2.0

~~1.1~~

Part 2

Agent Communication Language

Obsolete

Publication date: ~~23rd October, 1998~~ 28th November, 1997

Copyright © 1997, 1998 by FIPA - Foundation for Intelligent Physical Agents

Geneva, Switzerland

26

27 This is ~~one part of thea revised version interim update~~ of the FIPA 97 Specifications as
28 released/produced in October 1997.

29

30 ~~FIPA plans to produce a revision of the FIPA 97 specification in October 1998.~~

31

The latest version of this document may be found on the FIPA web site:

32

33

<http://www.drogo.eselt.it/fipa.org>

34

35

Comments and questions regarding this document and the specification therein should be
36 addressed to:

37

38

specsfipa97@fipa.orgnortel.co.uk

39

40

It is planned to introduce a web-based mechanism for submitting comments to the
41 specifications. They will be attended to promptly, see

42

Please refer to the FIPA web site for FIPA's latest policy and procedure for dealing with issues
43 regarding the specification.

44

45

46

Notice

47

48

Use of the technologies described in this specification may infringe patents, copyrights or other intellectual
49 property rights of FIPA Members and non-members. Nothing in this specification should be construed as
50 granting permission to use any of the technologies described. Anyone planning to make use of technology
51 covered by the intellectual property rights of others should first obtain permission from the holder(s) of the
52 rights. FIPA strongly encourages anyone implementing any part of this specification to determine first
53 whether part(s) sought to be implemented are covered by the intellectual property of others, and, if so, to
54 obtain appropriate licences or other permission from the holder(s) of such intellectual property prior to
55 implementation. This FIPA '97 Specification is subject to change without notice. Neither FIPA nor any of its
56 Members accept any responsibility whatsoever for damages or liability, direct or consequential, which may
result from the use of this specification.

171

172 **Foreword**

173 The Foundation for Intelligent Physical Agents (FIPA) is a non-profit association registered in
174 Geneva, Switzerland. FIPA's purpose is to promote the success of emerging agent-based
175 applications, services and equipment. This goal is pursued by making available in a timely manner,
176 internationally agreed specifications that maximise interoperability across agent-based
177 applications, services and equipment. This is realised through the open international collaboration
178 of member organisations, which are companies and universities active in the agent field. FIPA
179 intends to make the results of its activities available to all interested parties and to contribute the
180 results of its activities to appropriate formal standards bodies.

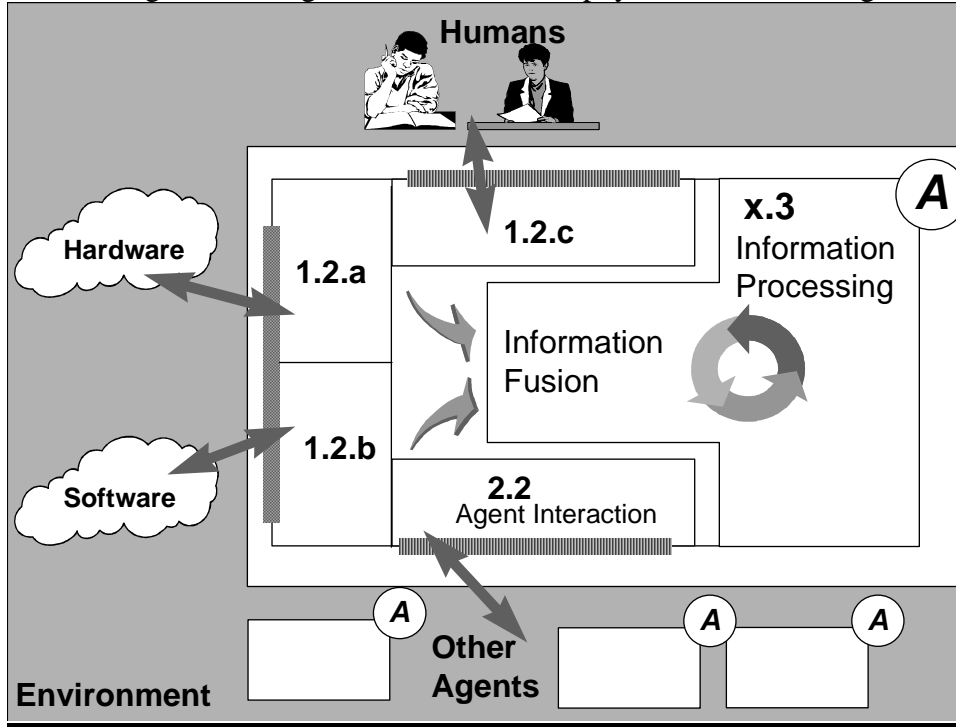

181 This specification has been developed through direct involvement of the FIPA membership. The 35 corporate
182 members of FIPA (October 1997) represent 12 countries from all over the world
183 Membership in FIPA is open to any corporation and individual firm, partnership, governmental body or
184 international organisation without restriction. By joining FIPA each Member declares himself individually
185 and collectively committed to open competition in the development of agent-based applications, services and
186 equipment. Associate Member status is usually chosen by those entities who do not want to be members of FIPA
187 without using the right to influence the precise content of the specifications through voting.
188 The Members are not restricted in any way from designing, developing, marketing and/or procuring
189 agent-based applications, services and equipment. Members are not bound to implement or use
190 specific agent-based standards, recommendations and FIPA specifications by virtue of their
191 participation in FIPA.

192 This specification is published as FIPA 97 ver. 1.0 after two previous versions have been subject to
193 public comments following disclosure on the WWW. It has undergone intense review by members
194 as well non-members. FIPA is now starting a validation phase by encouraging its members to carry
195 out field trials that are based on this specification. During 1998 FIPA will publish FIPA 97 ver. 2.0
196 that will incorporate whatever adaptations will be deemed necessary to take into account the
197 results of field trials.

198 **Introduction**

199 This FIPA 97 specification is the first output of the Foundation for Intelligent Physical Agents. It provides
 200 specification of basic agent technologies that can be integrated by agent systems developers to make complex
 201 systems with a high degree of interoperability.

202 FIPA specifies the interfaces of the different components in the environment with which an agent can
 203 interact, i.e. humans, other agents, non-agent software and the physical world. See figure below

204
 205

206 FIPA produces two kinds of specification:

207 **normative** specifications that mandate the external behaviour of an agent and ensure interoperability
 208 with other FIPA-specified subsystems;

209 **informative** specifications of applications for guidance to industry on the use of FIPA technologies.

210 The first set of specifications – called FIPA 97 – has seven parts:

211 three normative parts for basic agent technologies: agent management, agent communication language
 212 and agent/software integration

213 four informative application descriptions that provide examples of how the normative items can be
 214 applied: personal travel assistance, personal assistant, audio-visual entertainment and broadcasting and
 215 network management and provisioning.

216 Overall, the three FIPA 97 technologies allow:

217 the construction and management of an agent system composed of different agents, possibly built by
 218 different developers;

219 agents to communicate and interact with each other to achieve individual or common goals;

220 legacy software or new non-agent software systems to be used by agents.

221

222 A brief illustration of FIPA 97 specification is given below

223 **Part 1 Agent Management**

224 This part of FIPA 97 provides a normative framework within which FIPA compliant agents can exist, operate
225 and be managed.

226 It defines an agent platform reference model containing such capabilities as white and yellow pages, message
227 routing and life-cycle management. True to the FIPA approach, these capabilities are themselves intelligent
228 agents using formally sound communicative acts based on special message sets. An appropriate ontology and
229 content language allows agents to discover each other's capabilities.

230 **Part 2 Agent Communication Language**

231 The FIPA Agent Communication Language (ACL) is based on speech act theory: messages are actions, or
232 *communicative acts*, as they are intended to perform some action by virtue of being sent. The specification
233 consists of a set of message types and the description of their pragmatics, that is the effects on the mental
234 attitudes of the sender and receiver agents. Every communicative act is described with both a narrative form
235 and a formal semantics based on modal logic.

236 The specifications include guidance to users who are already familiar with KQML in order to facilitate
237 migration to the FIPA ACL.

238 The specification also provides the normative description of a set of high-level interaction protocols,
239 including requesting an action, contract net and several kinds of auctions etc.

240 **Part 3 Agent/Software Integration**

241 This part applies to any other non-agentised software with which agents need to "connect". Such software
242 includes legacy software, conventional database systems, middleware for all manners of interaction including
243 hardware drivers. Because in most significant applications, non-agentised software may dominate software
244 agents, part 3 provides important normative statements. It suggests ways by which Agents may connect to
245 software via "wrappers" including specifications of the wrapper ontology and the software dynamic
246 registration mechanism. For this purpose, an Agent Resource Broker (ARB) service is defined which allows
247 advertisement of non-agent services in the agent domain and management of their use by other agents, such
248 as negotiation of parameters (e.g. cost and priority), authentication and permission.

249 **Part 4 - Personal Travel Assistance**

250 The travel industry involves many components such as content providers, brokers, and personalization
251 services, typically from many different companies. In applying agents to this industry, various
252 implementations from various vendors must interoperate and dynamically discover each other as different
253 services come and go. Agents operating on behalf of their users can provide assistance in the pre-trip
254 planning phase, as well as during the on-trip execution phase. A system supporting these services is called a
255 PTA (Personal Travel Agent).

256 In order to accomplish this assistance, the PTA interacts with the user and with other agents, representing the
257 available travel services. The agent system is responsible for the configuration and delivery - at the right time,
258 cost, Quality of Service, and appropriate security and privacy measures - of trip planning and guidance
259 services. It provides examples of agent technologies for both the hard requirements of travel such as airline,
260 hotel, and car arrangements as well as the soft added-value services according to personal profiles, e.g.
261 interests in sports, theatre, or other attractions and events.

262 **Part 5 - Personal Assistant**

263 One central class of intelligent agents is that of a personal assistant (PA). It is a software agent that acts semi-
264 autonomously for and on behalf of a user, modelling the interests of the user and providing services to the
265 user or other people and PAs as and when required. These services include managing a user's diary, filtering
266 and sorting e-mail, managing the user's activities, locating and delivering (multimedia) information, and
267 planning entertainment and travel. It is like a secretary, it accomplishes routine support tasks to allow the user
268 to concentrate on the real job, it is unobtrusive but ready when needed, rich in knowledge about user and

269 work. Some of the services may be provided by other agents (e.g. the PTA) or systems, the Personal Assistant
270 acts as an interface between the user and these systems.

271 In the FIPA'97 test application, a Personal Assistant offers the user a unified, intelligent interface to the
272 management of his personal meeting schedule. The PA is capable of setting up meetings with several
273 participants, possibly involving travel for some of them. In this way FIPA is opening up a road for adding
274 interoperability and agent capabilities to the already established

275 ***Part 6 - Audio/Video Entertainment & Broadcasting***

276 An effective means of information filtering and retrieval, in particular for digital broadcasting networks, is of
277 great importance because the selection and/or storage of one's favourite choice from plenty of programs on
278 offer can be very impractical. The information should be provided in a customised manner, to better suit the
279 user's personal preferences and the human interaction with the system should be as simple and intuitive as
280 possible. Key functionalities such as profiling, filtering, retrieving, and interfacing can be made more
281 effective and reliable by the use of agent technologies.

282 Overall, the application provides to the user an intelligent interface with new and improved functionalities for
283 the negotiation, filtering, and retrieval of audio-visual information. This set of functionalities can be achieved
284 by collaboration between a user agent and content/service provider agent.

285 ***Part 7 - Network management & provisioning***

286 Across the world, numerous service providers emerge that combine service elements from different network
287 providers in order to provide a single service to the end customer. The ultimate goal of all parties involved is
288 to find the best deals available in terms of Quality of Service and cost. Intelligent Agent technology is
289 promising in the sense that it will facilitate automatic negotiation of appropriate deals and configuration of
290 services at different levels.

291 Part 7 of FIPA 1997 utilizes agent technology to provide dynamic Virtual Private Network (VPN) services
292 where a user wants to set up a multi-media connection with several other users.

293 The service is delivered to the end customer using co-operating and negotiating specialized agents. Three
294 types of agents are used that represent the interests of the different parties involved:

295 The Personal Communications Agent (PCA) that represents the interests of the human users.

296 The Service Provider Agent (SPA) that represents the interests of the Service Provider.

297 The Network Provider Agent (NPA) that represents the interests of the Network Provider.

298 The service is established by the initiating user who requests the service from its PCA. The PCA negotiates in
299 with available SPAs to obtain the best deal available. The SPA will in turn negotiate with the NPAs to obtain
300 the optimal solution and to configure the service at network level. Both SPA and NPA communicate with
301 underlying service- and network management systems to configure the underlying networks for the service.
302

304 1 Scope

305 **“Language is a very difficult thing to put into words” – Voltaire**

306 This document forms part two of the FIPA 97 specification for interoperable agents and agent societies. In
307 particular, this document lays out underlying principles and detailed requirements for agents to be able to
308 communicate with each other using messages representing communicative acts, independently of the specific
309 agent implementations.

310 The document lays out, in the sections below, the following:

311 A core set of communicative acts, their meaning and means of composition;

312 Common patterns of usage of these communicative acts, including standard composite messages, and
313 standard or commonly used interaction protocols;

314 A detailed semantic description of the underlying meaning of the core set of message primitives;

315 A summary of the relationship between the FIPA ACL and widely used *de facto* standard agent
316 communication language KQML.

317 ***Objectives of this document***

318 This document is intended to be directly of use to designers, developers and systems architects attempting to
319 design, build and test agent applications, particularly communities of multiple agents. It aims to lay out
320 clearly the practical components of inter-agent communication and co-operation, and explain the underlying
321 theory. Beyond a basic appreciation of the model of agent communication, readers can make practical use of
322 the ACL specification without necessarily absorbing the detail of the formal basis of the language.

323 However, the language does have a well-defined formal semantic foundation. The intention of this semantics
324 is that it both gives a deeper understanding of the meaning of the language to the formally inclined, and
325 provides an unambiguous reference point. This will be of increasing importance as agents, independently
326 developed by separate individuals and teams, attempt to inter-operate successfully.

327 This part of the FIPA 97 specification defines a language and supporting tools, such as protocols, to be used
328 by *intelligent software agents* to communicate with each other. The technology of software agents imposes a
329 high-level view of such agents, deriving much of its inspiration from social interaction in other contexts, such
330 as human-to-human communication. Therefore, the terms used and the mechanisms used support such a
331 higher-level, often *task based*, view of interaction and communication. The specification does not attempt to
332 define the low and intermediate level services often associated with communication between distributed
333 software systems, such as network protocols, transport services, etc. Indeed, the existence of such services
334 used to physically convey the byte sequences comprising the inter-agent communication acts are assumed.
335 No single, universal definition of a software agent exists, nor does this specification attempt to define one.
336 However, some characteristics of agent behaviour are commonly adopted, and the communication language
337 defined in this specification sets out to support and facilitate these behaviours. Such characteristics include,
338 but are not limited to:

339 Goal directed behaviour;

340 Autonomous determination of courses of action;

341 Interaction by negotiation and delegation;

342 Modelling of anthropomorphic mental attitudes, such as beliefs, intentions, desires, plans and
343 commitments;

344 Flexibility in responding to situations and needs.

345 No expectation is held that any given agent will necessarily embody any or all of these characteristics.

346 However, it is the intention of this part of the specification that such behaviours are supported by the
347 communication language and its supporting framework where appropriate.

348 **Note on conformance to the underlying semantic model**

349 The semantic model described in this document is given solely as an informative reference point for agent behaviour, as there is currently no
350 agreed technology for compliance testing against the semantics of the epistemic operators used in the model. This is due to the difficulty of
351 verifying that the mental attitudes of an agent conform to the specification, without dictating the agent's internal architecture or underlying
352 implementation model. As such, the semantics cannot be considered normative until the issue of compliance testing is resolved. Such tests will be
353 the subject of further FIPA work.

354 **2 Normative references**

355 The following normative documents contain provisions which, through reference in this text, constitute
356 provisions of this specification. For dated references, subsequent amendments to, or revisions of, any of these
357 publications do not apply. However, parties to agreements based on this specification are encouraged to
358 investigate the possibility of applying the most recent editions of the normative documents indicated below.
359 For undated references, the latest edition of the normative document referred to applies. Members of ISO and
360 IEC maintain registers of currently valid specifications.
361 *ISO/IEC 2022: Information technology - Character code.*
362 *FIPA 97 specification – Part 1: Agent Management.*
363 *FIPA 97 specification – Part 3: Agent/Software Integration.*

364 **3**

365 Terms and definitions

366 For the purposes of this specification, the following terms and definitions apply:

367 **Action**

368 A basic construct which represents some activity which an agent may perform. A special class of actions is
369 the communicative acts.

370 **ARB Agent**

371 An agent which provides the Agent Resource Broker (ARB) service. There must be at least one such an agent
372 in each Agent Platform in order to allow the sharing of non-agent services.

373 **Agent**

374 An Agent is the fundamental actor in a domain. It combines one or more service capabilities into a unified
375 and integrated execution model which can include access to external software, human users and
376 communication facilities.

377 **Agent Communication Language (ACL)**

378 A language with precisely defined syntax, semantics and pragmatics that is the basis of communication
379 between independently designed and developed software agents. ACL is the primary subject of this part of
380 the FIPA specification.

381 **Agent Communication Channel (ACC) Router**

382 The Agent Communication Channel is an agent which uses information provided by the Agent Management
383 System to route messages between agents within the platform and to agents resident on other platforms.

384 **Agent Management System (AMS)**

385 The Agent Management System is an agent which manages the creation, deletion, suspension, resumption,
386 authentication and migration of agents on the agent platform and provides a “white pages” directory service
387 for all agents resident on an agent platform. It stores the mapping between globally unique agent names (or
388 GUID) and local transport addresses used by the platform.

389 **Agent Platform (AP)**

390 An Agent Platform provides an infrastructure in which agents can be deployed. An agent must be registered
391 on a platform in order to interact with other agents on that platform or indeed other platforms. An AP consists
392 of three capability sets ACC, AMS and default Directory Facilitator.

393 **Communicative Act (CA)**

394 A special class of actions that correspond to the basic building blocks of dialogue between agents. A
395 communicative act has a well-defined, declarative meaning independent of the content of any given act. CA's
396 are modelled on speech act theory. Pragmatically, CA's are performed by an agent sending a message to
397 another agent, using the message format described in this specification.

398 **Content**

399 That part of a communicative act which represents the domain dependent component of the communication.
400 Note that "the content of a message" does not refer to "everything within the message, including the
401 delimiters", as it does in some languages, but rather specifically to the domain specific component. In the
402 ACL semantic model, a content expression may be composed from propositions, actions or IRE's.

403 **Conversation**

404 An ongoing sequence of communicative acts exchanged between two (or more) agents relating to some
405 ongoing topic of discourse. A conversation may (perhaps implicitly) accumulate context which is used to
406 determine the meaning of later messages in the conversation.

407 **Software System**

408 A software entity which is not conformant to the FIPA Agent Management specification.

409 **CORBA**

410 *Common Object Request Broker Architecture*, an established standard allowing object-oriented distributed
411 systems to communicate through the remote invocation of object methods.

412 **Directory Facilitator (DF)**

413 The Directory facilitator is an agent which provides a “yellow pages” directory service for the agents. It stores
414 descriptions of the agents and the services they offer.

415 **Feasibility Precondition (FP)**

416 The conditions (i.e. one or more propositions) which need be true before an agent can (plan to) execute an
417 action.

418 **Illocutionary effect**

419 See speech act theory.

420 **Knowledge Querying and Manipulation Language (KQML)**421 *A de facto* (but widely used) specification of a language for inter-agent communication. In practice, several
422 implementations and variations exist.423 **Local Agent Platform**424 The Local Agent Platform is the AP to which an agent is attached and which represents an ultimate
425 destination for messages directed to that agent.426 **Message**427 An individual unit of communication between two or more agents. A message corresponds to a
428 communicative act, in the sense that a message encodes the communicative act for reliable transmission
429 between agents. Note that communicative acts can be recursively composed, so while the outermost act is
430 directly encoded by the message, taken as a whole a given message may represent multiple individual
431 communicative acts.432 **Message content**

433 See content.

434 **Message transport service**435 The message transport service is an abstract service provided by the agent management platform to which the
436 agent is (currently) attached. The message transport service provides for the reliable and timely delivery of
437 messages to their destination agents, and also provides a mapping from agent logical names to physical
438 transport addresses.439 **Ontology**440 An ontology gives meanings to symbols and expressions within a given domain language. In order for a
441 message from one agent to be properly understood by another, the agents must ascribe the same meaning to
442 the constants used in the message. The ontology performs the function of mapping a given constant to some
443 well-understood meaning. For a given domain, the ontology may be an explicit construct or implicitly
444 encoded with the implementation of the agent.445 **Ontology sharing problem**446 The problem of ensuring that two agents who wish to converse do, in fact, share a common ontology for the
447 domain of discourse. Minimally, agents should be able to discover whether or not they share a mutual
448 understanding of the domain constants. Some research work is addressing the problem of dynamically
449 updating agents' ontologies as the need arises. This specification makes no provision for dynamically sharing
450 or updating ontologies.451 **Perlocutionary Effect**

452 See speech act theory.

453 **Proposition**454 A statement which can be either true or false. A closed proposition is one which contains no variables, other
455 than those defined within the scope of a quantifier.456 **Protocol**457 A common pattern of conversations used to perform some generally useful task. The protocol is often used to
458 facilitate a simplification of the computational machinery needed to support a given dialogue task between
459 two agents. Throughout this document, we reserve protocol to refer to dialogue patterns between agents, and
460 networking protocol to refer to underlying transport mechanisms such as TCP/IP.461 **Rational Effect (RE)**462 The rational effect of an action is a representation of the effect that an agent can expect to occur as a result of
463 the action being performed. In particular, the rational effect of a communicative act is the perlocutionary
464 effect an agent can expect the CA to have on a recipient agent.465 Note that the recipient is not bound to ensure that the expected effect comes about; indeed it may be
466 impossible for it to do so. Thus an agent may use its knowledge of the rational effect in order to plan an
467 action, but it is not entitled to believe that the rational effect necessarily holds having performed the act.468 **Speech Act Theory**469 A theory of communications which is used as the basis for ACL. Speech act theory is derived from the
470 linguistic analysis of human communication. It is based on the idea that with language the speaker not only
471 makes statements, but also performs actions. A speech act can be put in a stylised form that begins "I hereby

472 request ..." or "I hereby declare ...". In this form the verb is called the performative, since saying it makes it
 473 so. Verbs that cannot be put into this form are not speech acts, for example "I hereby solve this equation"
 474 does not actually solve the equation. [Austin 62, Searle 69].

475 In speech act theory, communicative acts are decomposed into locutionary, illocutionary and perlocutionary
 476 acts. Locutionary acts refers to the formulation of an utterance, illocutionary refers to a categorisation of the
 477 utterance from the speakers perspective (e.g. question, command, query, etc), and perlocutionary refers to the
 478 other intended effects on the hearer. In the case of the ACL, the perlocutionary effect refers to the updating of
 479 the agent's mental attitudes.

480 **Software Service**

481 An instantiation of a connection to a software system.

482 **TCP/IP**

483 A networking protocol used to establish connections and transmit data between hosts

484 **Wrapper Agent**

485 An agent which provides the FIPA-WRAPPER service to an agent domain on the Internet.

512 Overview of Inter-Agent Communication

513 5.1 Introduction

514 This specification document does not define in a precise, prescriptive way what an agent is nor how it should
515 be implemented. Besides the lack of a general consensus on this issue in the agent research community, such
516 definitions frequently fall into the trap of being overly restrictive, ruling out some software constructs whose
517 developers legitimately consider to be agents, or else overly weak and of little assistance to the reader or
518 software developer. A goal of this specification is to be as widely applicable as possible, so the stance taken
519 is to define the components as precisely as possible, and allow applicability in any particular instance to be
520 decided by the reader.

521 Nevertheless, some position must be taken on some of the characteristics of an agent, that it, on what an agent
522 can *do*, in order that the specification can specify a means of doing it. This position is outlined here, and
523 consists of an *abstract characterisation* of agent properties, and a simple abstract model of inter-agent
524 communication.

525 The first characteristic assumed is that agents are communicating at a higher level of discourse, i.e. that the
526 contents of the communication are meaningful statements about the agents' environment or knowledge. This
527 is one characteristic that differentiates agent communication from, for example, other interactions between
528 strongly encapsulated computational entities such as method invocation in CORBA.

529 In order for this discourse to be given meaning, some assumptions have to be made about the agents. In this
530 specification, an abstract characterisation of agents is assumed, in which some core capabilities of agents are
531 described in terms of the agent's *mental attitudes*. This characterisation or model is intended as an abstract
532 specification, i.e. it does not pre-determine any particular agent implementation model nor a cognitive
533 architecture.

534 More specifically, this specification characterises an agent as being able to be described as though it has
535 mental attitudes of:

536 **Belief**, which denotes the set of propositions (statements which can be true or false) which the agent
537 accepts are (currently) true; propositions which are believed false are represented by believing the
538 negation of the proposition.

539 **Uncertainty**, which denotes the set of propositions which the agent accepts are (currently) not
540 known to be certainly true or false, but which are held to be more likely to be true than false;
541 propositions which are uncertain but more likely to be false are represented by being uncertain of the
542 negation of the proposition. Note that this attitude does not prevent an agent from adopting a specific
543 uncertain information formalism, such as probability theory, in which a proposition is believed to
544 have a certain degree of support. Rather the uncertainty attitude provides a least commitment
545 mechanism for agents with differing representation schemes to discuss uncertain information.

546 **Intention**, which denotes a *choice*, or property or set of properties of the world which the agent
547 desires to be true and which are not currently believed to be true. An agent which adopts an intention
548 will form a plan of action to bring about the state of the world indicated by its choice.

549 Note that, with respect to some given proposition p , the attitudes of believing p , believing *not* p , being
550 uncertain of p and being uncertain of *not* p are mutually exclusive.

551 In addition, agents understand and are able to perform certain *actions*. In a distributed system, an agent
552 typically will only be able to fulfil its intentions by influencing other agents to perform actions.

553 Influencing the actions of other agents is performed by a special class of actions, denoted *communicative*
554 *acts*. A communicative act is performed by one agent towards another. The mechanism of performing a
555 communicative act is precisely that of sending a message encoding the act. Hence the roles of initiator and

556 recipient of the communicative act are frequently denoted as the *sender* and *receiver* of the message,
557 respectively.

558 Building from a well-defined core, the messages defined in this specification represent a set of
559 communicative acts that attempt to seek a balance between generality, expressive power and simplicity,
560 together with perspicuity to the agent developer. The message type defines the communicative action that is
561 being performed. Together with the appropriate domain knowledge, the communicative act allows the
562 receiver to determine the meaning of the contents of the message.

563 The meanings of the communicative acts given in ~~§06.5 — Catalogue of Communicative Acts~~
564 ~~— Catalogue of Communicative Acts~~ are given in terms of the pre-conditions in respect to the sender's
565 mental attitudes, and the expected (from the sender's point of view) consequences on the receiver's mental
566 attitudes. However, since the sender and receiver are independent, there is no guarantee that the expected
567 consequences come to pass. For example, agent *i* may believe that "it is better to read books than to watch
568 TV", and may intend *j* to come to believe so also. Agent *i* will, in the ACL, *inform j* of its belief in the truth
569 of that statement. Agent *j* will then know, from the semantics of *inform*, that *i* intends it to believe in the
570 value of books, but whether *j* comes itself to believe the proposition is a matter for *j* alone to decide.
571 This specification concerns itself with inter-agent communication through message passing. Key sections of
572 the discussion are as follows:

573 ~~§05.2 Message Transport Mechanisms~~~~5.2 — Message Transport Mechanisms~~ discusses the
574 transportation of messages between agents;

575 ~~§06.3 Message structure~~~~6.3 — Message structure~~ introduces the structure of messages;

576 ~~§06.4 Message syntax~~~~6.4 — Message syntax~~ gives a standard transport syntax for transmitting ACL
577 messages over simple byte streams;

578 ~~§06.5 Catalogue of Communicative Acts~~~~6.5 — Catalogue of Communicative Acts~~ catalogues the
579 standardised communicative acts and their representation as messages;

580 ~~§0Interaction Protocols~~~~Interaction Protocols~~ introduces and defines a set of communication protocols
581 to simplify certain common sequences of messages;

582 ~~§0Formal basis of ACL semantics~~~~Formal basis of ACL semantics~~ formally defines the underlying
583 communication model.

584 **5.2 Message Transport Mechanisms**

585 For two agents to communicate with each other by exchanging messages, they must have some common
586 meeting point through which the messages are delivered. The existence and properties of this *message*
587 *transport service* are the remit of FIPA Technical Committee 1: Agent Management.

588 The ACL presented here takes as a position that the contribution of agent technology to complex system
589 behaviour and inter-operation is most powerfully expressed at what, for the lack of a better term, may be
590 called the higher levels of interaction. For example, this document describes communicative acts for
591 informing about believed truths, requesting complex actions, protocols for negotiation, etc. The interaction
592 mechanisms presented here do not compete with, nor should they be compared to, low-level networking
593 protocols such as TCP/IP, the OSI seven layer model, etc. Nor do they directly present an alternative to
594 CORBA, Java RMI or Unix RPC mechanisms. However, the functionality of ACL does, in many ways
595 overlap with the foregoing examples, not least in that ACL messages may often be expected to be delivered
596 via such mechanisms.

597 The ACL's role may be further clarified by consideration of the FIPA goal of general open agent systems.
598 Other mechanisms, notably CORBA, share this goal, but do so by imposing certain restrictions on the
599 interfaces exposed by objects. History suggests that agents and agent systems are typically implemented with
600 a greater variety of interface mechanisms; existing example agents include those using TCP/IP sockets,
601 HTTP, SMTP and GSM short messages. ACL respects this diversity by attempting to minimise requirements

602 on the message delivery service. Notably, the minimal message transport mechanism is defined as a textual
 603 form delivered over a simple byte stream, which is also the approach taken by the widely used KQML agent
 604 communication language. A potential penalty for this inclusive approach is upon very high-performance
 605 systems, where message throughput is pre-eminent. Future versions of this specification may define
 606 alternative transport mechanism assumptions, including other transport syntaxes, which meet the needs of
 607 very high performance systems.

608 Currently, the ACL imposes a minimal set of requirements on the message transport service, as shown below:

- 609 a) The message service is able to deliver a message, encoded in the transport form below, to a destination as
 610 a sequence of bytes. The message service exposes through its interface whether it is able to cope reliably
 611 with 8-bit bytes whose high-order bit may be set.
- 612 b) The normal case is that the message service is *reliable* (well-formed messages will arrive at the
 613 destination) *accurate* (the message is received in the form in which it was sent), and *orderly* (messages
 614 from agent a to agent b arrive at b in the order in which they were sent from a¹). Unless informed
 615 otherwise, an agent is entitled to assume that these properties hold.
- 616 c) If the message delivery service is unable to guarantee any or all of the above properties, this fact is
 617 exposed in some way through the interface to the message delivery service
- 618 d) An agent will have the option of selecting whether it suspends and waits for the result of a message
 619 (synchronous processing) or continues with other unrelated tasks while waiting for a message reply
 620 (asynchronous processing). The availability of this behaviour will be implementation specific, but it must
 621 be made explicit where either behaviour is not supported.
- 622 e) Parameters of *the act of delivering a message*, such as time-out if no reply, are not codified at the
 623 message level but are part of the interface exposed by the message delivery service.
- 624 f) The message delivery service will detect and report error conditions, such as: ill-formed message,
 625 undeliverable, unreachable agent, etc., back to the sending agent. Depending on the error condition, this
 626 may be returned either as a return value from the message sending interface, or through the delivery of an
 627 appropriate error message.
- 628 g) An agent has a name which will allow the message delivery service to deliver the message to the correct
 629 destination. The message delivery service will be able to determine the correct transport mechanism
 630 (TCP/IP, SMTP, http, etc.), and will allow for changes in agent location, as necessary.

631 The agent will, in some implementation specific way, have an structure which corresponds to a message it
 632 wishes to send or has received. The syntax shown below in this document defines a *transport form*, in which
 633 the message is mapped from its internal form to a character sequence, and can be mapped back to the internal
 634 message form from a given character sequence. Note again the absence of architectural commitment: the
 635 internal message form *may* be a explicit data structure, or it *may* be implicit in the way that the agent handles
 636 its messages.

637 For the purposes of the transport services, the message may be assumed to be an opaque byte stream, with the
 638 exception that it is possible to extract the destination of the message.

639 At this transport level, messages are assumed to be encoded in 7-bit characters according to the
 640 ISO/IEC 2022 standard. This specification allows the expression of characters in extended character sets,
 641 such as Japanese. The FIPA specification adopts the position that the default character mapping is US ASCII.
 642 More specifically, all ACL compliant agents should assume that, when communication is commenced:

- 643 ISO/IEC 646 (US ASCII) is designated to G0;
- 644 ISO/IEC 6429 C0 is designated;
- 645 G0 is invoked in GL;
- 646 C0 is invoked in CL;

¹ Though possibly interspersed with messages from some other agent c.

647 SPACE in 2/0 (0x20) and

648 DELETE in 7/15 (0x7f)

649 Some transport services will be able to transport 8-bit characters safely, and, where this service is available,
650 the agent is free to make use of it. However, safe transmission of 8-bit characters is not universally assumed.

651 **6**

652 FIPA ACL Messages

653 6.1 Preamble

654 This section defines the individual message types that are central to the ACL specification. In particular, the
 655 form of the messages and meaning of the message types are defined. The message types are a reference to the
 656 semantic acts defined in this specification. These types impart a meaning to the whole message, that is, the
 657 act and the content of the message, which extends any intrinsic meaning that the content itself may have.
 658 For example, if i informs j that “Bonn is in Germany”, the content of the message from i to j is “Bonn is in
 659 Germany”, and the act is the act of *informing*. “Bonn is in Germany” has a certain meaning, and is true under
 660 any reasonable interpretation of the symbols “Bonn” and “Germany”, but the meaning of the message
 661 includes effects on (the mental attitudes of) agents i and j . The determination of this effect is essentially a
 662 private matter to both i and j , but for meaningful communication to take place, some reasonable expectations
 663 of those effects must be fulfilled.

664 Clearly, the content of a message may range over an unrestricted range of domains. This specification does
 665 not mandate any one formalism for representing message content. Agents themselves must arrange to be able
 666 to interpret any given message content correctly. Note that this version of the specification does not address
 667 the *ontology sharing problem*, though future versions may do so. The specification does set out to specify the
 668 meanings of the acts independently of the content, that is, extending the above example, what it means to
 669 inform or be informed. In particular, a set of standard communicative acts and their meanings is defined.
 670 It may be noted, however, that there is a trade-off between the power and specificity of the acts. Notionally, a
 671 large number of very specific act types, which convey nuances of meaning, can be considered equivalent to a
 672 smaller number of more general ones, but they place different representational and implementation
 673 constraints on the agents. The goals of the set of acts presented here are (i) to cover, overall, a wide range of
 674 communication situations, (ii) not to overtax the design of simpler agents intended to fulfil a specific, well-
 675 defined purpose, and (iii) to minimise redundancy and ambiguity, to facilitate the agent to choose which
 676 communicative act to employ. Succinctly, the goals are: completeness, simplicity and conciseness.

677 The fundamental view of messages in ACL is that a message represents a *communicative act*. For purposes of
 678 elegance and coherency, the treatment of communicative acts during dialogue should be consistent with the
 679 treatment of other actions; a given communicative action is just one of the actions that an agent can perform.
 680 The term *message* then plays two distinct roles within this document, depending on context. *Message* can be
 681 a synonym for *communicative act*, or it may refer to the computational structure used by the message delivery
 682 service to convey the agent's utterance to its destination.

683 The communication language presented in this specification is based on a precise formal semantics, giving an
 684 unambiguous meaning to communicative actions. In practice, this formal basis is supplemented with
 685 pragmatic extensions that serve to ease the practical implementation of effective inter-agent communications.
 686 For this reason, the message *parameters* defined below are not defined in the formal semantics in §[0Formal-
 687 basis of ACL semantics](#)~~Formal basis of ACL semanties~~, but are defined in narrative form in the sections
 688 below. Similarly, conventions that agents are expected to adopt, such as protocol of message exchange, are
 689 given an operational semantics in narrative form only.

690 6.2 Requirements on agents

691 This document introduces a set of pre-defined message types and protocols that are available for all agents to
 692 use. However, it is not required for all agents to implement all of these messages. In particular, the minimal
 693 requirements on FIPA ACL compliant agents are as follows:

Requirement 111:

Agents should send *not-understood* if they receive a message that they do not recognise or they are unable to process the content of the message. Agents must be prepared to receive and properly handle a *not-understood* message from other agents.

Requirement 222:

An ACL compliant agent may choose to implement any subset (including all, though this is unlikely) of the pre-defined message types and protocols. The implementation of these messages must be correct with respect to the referenced act's semantic definition.

Requirement 333:

An ACL compliant agent which uses the communicative acts whose names are defined in this specification must implement them correctly with respect to their definition.

Requirement 4:

Agents may use communicative acts with other names, not defined in this document, and are responsible for ensuring that the receiving agent will understand the meaning of the act. However, agents should not define new acts with a meaning that matches a pre-defined standard act.

Requirement 5:

An ACL compliant agent must be able to correctly generate a syntactically well formed message in the transport form that corresponds to the message it wishes to send. Symmetrically, it must be able to translate a character sequence that is well-formed in the transport syntax to the corresponding message.

694
695

6.3 Message structure

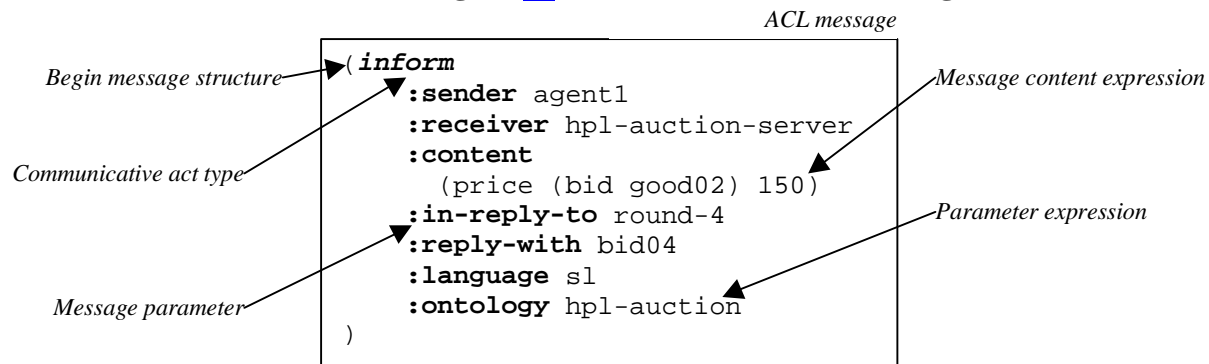

696 This section introduces the various structural elements of a message.

697 **6.3.1 Overview of ACL messages**

698 The following figure summarises the main structural elements of an ACL message:

699

Figure 111 — Components of a message

700
701
702
703
704
705
706
707
708

In their transport form, messages are represented as s-expressions. The first element of the message is a word which identifies the communicative act being communicated, which defines the principal meaning of the message. There then follows a sequence of message parameters, introduced by parameter keywords beginning with a colon character. No space appears between the colon and the parameter keyword. One of the parameters contains the content of the message, encoded as an expression in some formalism (see below). Other parameters help the message transport service to deliver the message correctly (e.g. sender and receiver), help the receiver to interpret the meaning of the message (e.g. language and ontology), or help the receiver to respond co-operatively (e.g. reply-with, reply-by).

709 It is this transport form that is serialised as a byte stream and transmitted by the message transport service.
 710 The receiving agent is then responsible for decoding the byte stream, parsing the components message and
 711 processing it correctly.
 712 Note that the message's communicative act type corresponds to that which in KQML is called the
 713 *performative*²).

714 **6.3.2 Message parameters**

715 As noted above, the message contains a set of one or more parameters. Parameters may occur in any order in
 716 the message. The only parameter that is mandatory in all messages is the *:receiver* parameter, so that the
 717 message delivery service can correctly deliver the message. Clearly, no useful message will contain only the
 718 receiver. However, precisely which other parameters are needed for effective communication will vary
 719 according to the situation.

720 The full set of pre-defined message parameters is shown in the following table:

721 **Table 111 — Pre-defined message parameters**

Message Parameter:	Meaning:
<i>:sender</i>	Denotes the identity of the sender of the message, i.e. the name of the agent of the communicative act.
<i>:receiver</i>	Denotes the identity of the intended recipient of the message. Note that the recipient may be a single agent name, or a tuple of agent names. This corresponds to the action of multicasting the message. Pragmatically, the semantics of this multicast is that the message is sent to each agent named in the tuple, and that the sender intends each of them to be recipient of the CA encoded in the message. For example, if an agent performs an inform act with a tuple of three agents as receiver, it denotes that the sender intends each of these agent to come to believe the content of the message.
<i>:content</i>	Denotes the content of the message; equivalently denotes the object of the action.

² Note that the use of *performative* with respect to all of the messages defined in KQML has been challenged. The term is repeated here only because it will be familiar to many readers.

:reply-with	Introduces an <i>expression</i> which will be used by the agent responding to this message to identify the original message. Can be used to follow a conversation thread in a situation where multiple dialogues occur simultaneously. E.g. if agent i sends to agent j a message which contains :reply-with query1, agent j will respond with a message containing :in-reply-to query1.
:in-reply-to	Denotes an expression that references an earlier action to which this message is a reply.
:envelope	Denotes an expression that provides useful information about the message as seen by the message transport service. The content of this parameter is not defined in the specification, but may include time sent, time received, route, etc. The structure of the envelope is a list of keyword value pairs, each of which denotes some aspect of the message service.
:language	Denotes the encoding scheme of the content of the action.
:ontology	Denotes the ontology which is used to give a meaning to the symbols in the content expression.
:reply-by	Denotes a time and/or date expression which indicates a guideline on the latest time by which the sending agent would like a reply.
:protocol	Introduces an identifier which denotes the <i>protocol</i> which the sending agent is employing. The protocol serves to give additional context for the interpretation of the message. Protocols are discussed in § 0Interaction Protocols Interaction Protocols .
:conversation-id	Introduces an expression which is used to identify an ongoing sequence of communicative acts which together form a conversation. A conversation may be used by an agent to manage its communication strategies and activities. In addition the conversation may provide additional context for the interpretation of the meaning of a message.

722

723 **6.3.3 Message content**

724 The *content* of a message refers to whatever the communicative act applies to. If, in general terms, the
725 communicative act is considered as a sentence, the content is the grammatical object of the sentence. In

726 general, the content can be encoded in any language, and that language will be denoted by the : language
727 parameter. The only requirement on the content language is that it has the following properties:

Requirement 6:

In general, a content language must be able to express propositions, objects and actions. No other properties are required, though any given content language may be much more expressive than this. More specifically, the content of a message must express the data type of the action: propositions for inform, actions for request, etc.

728 A *proposition* states that some sentence in a language is true or false. An *object*, in this context, is a
729 construct which represents an identifiable "thing" (which may be abstract or concrete) in the domain
730 of discourse. Object in this context does not necessarily refer to the specialised programming
731 constructs that appear in *object-oriented* languages like C++ and Java. An *action* is a construct that
732 the agent will interpret as being an activity which can be carried out by some agent. In general, an
733 action does not produce a result which is communicated to another agent (but see, for example,
734 $\$(iota \langle variable \rangle \langle term \rangle)$
735 The *iota* operator introduces a scope for the given *expression* (which denotes a term), in which the
736 given *identifier*, which would otherwise be free, is defined. An expression containing a free variable
737 is not a well-formed SL expression. The expression "(iota x (P x))" may be read as "the x such that P
738 [is true] of x. The *iota* operator is a constructor for terms which denote objects in the domain of
739 discourse.

740 B.2.5(~~*iota* $\langle variable \rangle \langle term \rangle$~~)

741 The *iota* operator introduces a scope for the given *expression* (which denotes a term), in which the
742 given *identifier*, which would otherwise be free, is defined. An expression containing a free variable
743 is not a well formed SL expression. The expression "(iota x (P x))" may be read as "the x such that P
744 [is true] of x. The *iota* operator is a constructor for terms which denote objects in the domain of
745 discourse.

746 ~~B.2.5B.2.5(*iota* $\langle variable \rangle \langle term \rangle$)~~

747 The *iota* operator introduces a scope for the given *expression* (which denotes a term), in which the
748 given *identifier*, which would otherwise be free, is defined. An expression containing a free variable
749 is not a well formed SL expression. The expression "(iota x (P x))" may be read as "the x such that P
750 [is true] of x. The *iota* operator is a constructor for terms which denote objects in the domain of
751 discourse.

752 ~~B.2.5B.2.5).~~

753 Except in the special case outlined below, there is no requirement that message content languages conform to
754 any well known (pre-defined) syntax. In other words, it is the *responsibility of the agents in a dialogue* to
755 ensure that they are using a mutually comprehensible content language. This FIPA specification does not
756 mandate the use of any particular content language. One suggested content language formalism is shown in
757 ~~Annex BAnnex BAnnex BAnnex BAnnex B~~. There are many ways to ensure the use of a common content
758 language. It may be arranged by convention (e.g. such-and-such agents are well known always to use Prolog),
759 by negotiation³ among the parties, or by employing the services of an intermediary as a translator. Similarly,
760 the agents are responsible for ensuring that they are using a common ontology.

761 The most general case is that of negotiating (i.e. jointly deciding) a content language. However, the agent
762 must overcome the problem of being able to begin the conversation in the first place, in order that they can
763 then negotiate content language. There has to be a common point of reference, known in advance to both

³ The simplest case of such negotiations is where an agent publishes its admissible content language(s) in its registration entry, and other agents simply adopt the use of the stated language or don't talk to it.

parties. Thus, for the specific purpose of registering with a directory facilitator and performing other key agent management functions, the specification does include the following content language definition:

Definition 14:

The FIPA specification agent management content language is an s-expression notation used to express the propositions, objects and actions pertaining to the management of the agent's lifecycle. The terms in the expression are defined operationally in part one of the FIPA 97 specification.

Requirement 7:

A compliant agent is required to exercise the standard agent management capabilities through the use of messages using the agent management content language and ontology. The language and ontology are each denoted by the reserved term `fipa-agent-management` in their respective parameters.

6.3.4 Representing the content of messages

As noted above, the content of a message refers to the domain expression which the communicative act refers to. It is encoded in the message as the value of the `:content` parameter. The FIPA specification does not mandate any particular content encoding language (i.e. the representation form of the `:content` expression) on a normative basis. The SL content language is provided in Annex B on an informative basis.

To facilitate the encoding of simple languages (that is, simple in their syntactic requirements), the s-expression form included in the ACL grammar shown below allows the construction of s-expressions of arbitrary depth and complexity. A language which is defined as a sub-grammar of the general s-expression grammar is therefore admissible as a legal ACL message without modification. The SL grammar shown in Annex B is an example of exactly this approach.

However, agents commonly need to embed in the body of the message an expression encoded in a notation other than the simple s-expression form used for the messages themselves. The ACL grammar provides two mechanisms, both of which avoid the problem of an ACL parser being required to parse any expression in any language:

Wrap the expression in double quotes, thus making it a string in ACL syntax, and protect any embedded double quote in the embedded expression with a backslash. Note that backslash characters in the content expression must also be protected. E.g.:

```
(inform :content "owner( agent1, \"Ian\" ) "  
      :language Prolog  
  ... )
```

Prefix the expression with the appropriate length encoded string notation, thus ensuring that the expression will be treated as one lexical token irrespective of its structure. E.g.:

```
(inform :content #22"owner( agent1, "Ian" )  
      :language Prolog  
  ... )
```

As a result, an ACL parser will generate one lexical token, a string, representing the entire embedded language expression. Once the message has been parsed, the token representing the content expression can be interpreted according to its encoding scheme, which will by then be known from the `:language` parameter.

6.3.5 Use of MIME for additional content expression encoding

Sometimes, even the mechanisms in the previous section are not flexible enough to represent the full range of types of expression available to an agent. An example may be when an agent wishes to express a concept such as “the sound you asked for is <a digitised sound>”. Alternatively, it may wish to express some content in a language or character set encoding different from that used for the description of the content, such as “the translation of error message <some English text> into Japanese is <some Japanese text>”.

805 The Multipurpose Internet Mail Extensions (MIME) standard was developed to address similar issues in the
 806 context of Internet mail messages [Freed & Borenstein 96]. The syntactic form of MIME headers is suited
 807 particularly to the format of mail messages, and is not congruent with the transport syntax defined for FIPA
 808 ACL messages. However, the capabilities provided by MIME, and in particular the now widely used notation
 809 for annotating content types is a capability of great value to some categories of agent. To allow for this, an
 810 agent may optionally be able to process MIME content expression descriptions as wrappers around a given
 811 expression, using an extension of the ACL message syntax.
 812 It is not a mandatory part of this specification that all agents be able to process MIME content descriptions.
 813 However, MIME-capable agents can register this ability with their directory facilitator, and then proceed to
 814 use the format defined in Annex D.
 815 Note that, for the specific task of encoding language specific character sets, the ISO 2022 standard which is
 816 the base level character encoding of the message stream is capable of supporting a full range of international
 817 character encodings.

818 6.3.6 Primitive and composite communicative acts

819 This document defines a set of predefined communicative acts, each of which is given a specific meaning in
 820 the specification. Pragmatically, each of these communicative acts may be treated equivalently: they have
 821 equal status. However, in terms of definition and the determination of the formal meaning of the
 822 communicative acts, we distinguish two classes: *primitive acts* and *composite acts*.

823 Primitive communicative acts are those whose actions are defined atomically, i.e. they are not defined in
 824 terms of other acts. Composite communicative acts are the converse. Acts are *composed* by one of the
 825 following methods:

826 making one communicative act the object of another. For example, "I *request* you to *inform* me whether
 827 it is raining" is the composite *query-if* act.

828 using the *composition operator* “;” to sequence actions

829 using the composition operator “|” to denote a non-deterministic choice of actions.

830 The sequencing operator is written as an infix semicolon. Thus the expression:

831 a ; b

832 denotes an action, whose meaning is that of action a followed by action b.

833 The non-deterministic choice operator is written as an infix vertical bar. Thus the expression:

834 a | b

835 denotes a *macro action*, whose meaning is that of either action a, or action b, but not both. The action may
 836 occur in the past, present or future, or not at all.

837 Note that a macro action must be treated slightly differently than other communicative acts. A macro action
 838 can be planned by an agent, and requested by one agent of another. However, a macro act will not appear as
 839 the outermost (i.e. top-level) message being sent from one agent to another. Macro acts are used in the
 840 definition of new composite communicative acts. For example, see the *inform-if* act in §[0inform-if \(macro-act\)](#)
 841 [act](#)inform-if (macro-act).

842 The definition of composite actions in this way is part of the underlying semantic model for the ACL, defined
 843 using the semantic description language SL. Action composition as described above is not part of the
 844 concrete syntax for ACL. However, these operators are defined in the concrete syntax for SL used as a
 845 content language in [Annex B](#)~~Annex B~~~~Annex B~~~~Annex B~~~~Annex B~~.

846 6.4 Message syntax

847 This section defines the message transport syntax. The syntax is expressed in standard EBNF format. For
 848 completeness, the notation is as follows:

Grammar rule component	Example
------------------------	---------

Terminal tokens are enclosed in double quotes	" ("
Non terminals are written as capitalised identifiers	Expression
Square brackets denote an optional construct	[", " OptionalArg]
Vertical bar denotes an alternative	Integer Real
Asterisk denotes zero or more repetitions of the preceding expression	Digit *
Plus denotes one or more repetitions of the preceding expression	Alpha +
Parentheses are used to group expansions.	(A B) *
Productions are written with the non-terminal name on the lhs, expansion on the rhs, and terminated by a full stop.	ANonTerminal = "an expansion".

849 Some slightly different rules apply for the generation of lexical tokens. Lexical tokens use the same notation
 850 as above, except:

Lexical rule component	Example
Square brackets enclose a character set	["a", "b", "c"]
Dash in a character set denotes a range	["a" - "z"]
Tilde denotes the complement of a character set if it is the first character	[~ "(,)"]
Post-fix question-mark operator denotes that the preceding lexical expression is optional (may appear zero or one times)	["0" - "9"]? ["0" - "9"]

851

852 6.4.1 Grammar rules for ACL message syntax

853 This section defines the grammar for ACL.

854 ACLCommunicativeAct = Message.

855

856 Message = "(" MessageType MessageParameter* ")".

857

858 MessageType = "accept-proposal "

859 | "agree "

860 | "cancel "

861 | "cfp "

862 | "confirm "

863 | "disconfirm "

864 | "failure "

865 | "inform "

866 | "inform-if "

867 | "inform-ref "

868 | "not-understood "

869 | "propose "

870 | "query-if "

871 | "query-ref "

872 | "refuse "

873 | "reject-proposal "

```

874         | "request"
875         | "request-when"
876         | "request-whenever"
877         | "subscribe".
878
879 MessageParameter = ":sender" AgentName
880                 | ":receiver" RecipientExpr
881                 | ":content" ( Expression | MIMEEnhancedExpression )
882                 | ":reply-with" Expression
883                 | ":reply-by" DateTimeToken
884                 | ":in-reply-to" Expression
885                 | ":envelope" KeyValuePairList
886                 | ":language" Expression
887                 | ":ontology" Expression
888                 | ":protocol" Word
889                 | ":conversation-id" Expression.
890
891 Expression      = Word
892                 | String
893                 | Number
894                 | "(" Expression * ")".
895
896 MIMEEnhancedExpression - optional extension. See Annex D.
897
898 KeyValuePairList = "(" KeyValuePair * ")".
899
900 KeyValuePair    = "(" Word Expression ")".
901
902 RecipientExpr   = AgentName
903                 | "(" AgentName + ")".
904
905 AgentName       = Word
906                 | Word "@" URL.
907
908 URL             = Word.
909
910 Lexical rules
911 Word            = [ ~ "\0x00" - "\0x20",
912                 "(", ",", ")", "#", "0"-"9", "-", "@" ]
913                 [ ~ "\0x00" - "\0x20",
914                 "(", ",", ")" ] *.
915 String          = StringLiteral
916                 | ByteLengthEncodedString.
917
918 StringLiteral   = "\"
919                 ( [ ~ "\"" ] | "\\\" " ) *
920                 "\".
921 ByteLengthEncodedString = "#" ["0" - "9"]+ "\"
922                 <byte sequence>.
923 Number          = Integer | Float.
924
925 DateTimeToken  = "+" ?

```

```

926         Year Month Day "T"
927         Hour Minute Second MilliSecond
928         (TypeDesignator ?).
929
930 Year           = Digit Digit Digit Digit.
931 Month         = Digit Digit.
932 Day           = Digit Digit.
933 Hour          = Digit Digit.
934 Minute        = Digit Digit.
935 Second        = Digit Digit.
936 MilliSecond  = Digit Digit Digit.
937 TypeDesignator = AlphaCharacter.
938
939 Digit         = ["0" - "9"].
940

```

941 6.4.2 Notes on grammar rules

- 942 a) The standard definitions for integers and floating point numbers are assumed.
- 943 b) All keywords are case-insensitive.
- 944 c) A length encoded string is a context sensitive lexical token. Its meaning is as follows: the header of the
945 token is everything from the leading "#" to the separator " inclusive. Between the markers of the header is
946 a decimal number with at least one digit. This digit then determines that *exactly* that number of 8-bit
947 bytes are to be consumed as part of the token, without restriction. It is a lexical error for less than that
948 number of bytes to be available.

949 Note that not all implementations of the agent communication channel (ACC) [see Part One of the FIPA
950 97 specification] will support the transparent transmission of 8-bit characters. It is the responsibility of
951 the agent to ensure, by reference to the API provided for the ACC, that a given channel is able to
952 faithfully transmit the chosen message encoding.

- 953 d) A well-formed message will obey the grammar, and in addition, will have at most one of each of the
954 parameters. It is an error to attempt to send a message which is not well formed. Further rules on well-
955 formed messages may be stated or implied the operational definitions of the values of parameters as these
956 are further developed.
- 957 e) Strings encoded in accordance with ISO/IEC 2022 may contain characters which are otherwise not
958 permitted in the definition of `Word`. These characters are ESC (0x1B), SO (0x0E) and SI (0x0F). This is
959 due to the complexity that would result from including the full ISO/IEC 2022 grammar in the above
960 EBNF description. Hence, despite the basic description above, a word may contain any well-formed
961 ISO/IEC 2022 encoded character, other (representations of) parentheses, spaces, or the “#” character.
962 Note that parentheses may legitimately occur as *part* of a well formed escape sequence; the preceding
963 restriction on characters in a word refers only to the encoded characters, not the form of the encoding.
- 964 f) Time tokens are based on the ISO 8601 format, with extensions for relative time and millisecond
965 durations. Time expressions may be absolute, or relative to the current time. Relative times are
966 distinguished by the character "+" appearing as the first character in the construct. If no type designator is
967 given, the local timezone is used. The type designator for UTC is the character "Z". UTC is preferred to
968 prevent timezone ambiguities. Note that years must be encoded in four digits. As examples, 8:30 am on
969 April 15th 1996 local time would be encoded as:

971 19960415T083000000

972 the same time in UTC would be:

973 19960415T083000000Z

974 while one hour, 15 minutes and 35 milliseconds from now would be:
975 +00000000T011500035.

- 976 g) The format defined for agent names is taken from part one of the FIPA 97 standard. The option of simply
977 using a word as the agent name is only valid where that word can be unambiguously resolved to an full
978 agent name in the format given. A well-formed URL has the standard form:

979 AccessTypeSpecifier "://" InternetAddress ":" PortNumber "/" Identifier

980 This specification is not included as a first-class production in the above grammar due to context
981 sensitivity, in other grammatical contexts such strings may legitimately be treated as opaque words.

982 **6.5 Catalogue of Communicative Acts**

984 This section defines all of the communicative acts that are part of this specification. Each message is defined
985 by an informal narrative in this section, and more formally in ~~§08~~

986 Formal basis of ACL semantics~~8~~

987 ~~Formal basis of ACL semantics.~~ The narrative and formal definitions are intended to be equivalent. However,
988 in the case of an ambiguity or inconsistency, the formal definition is the final reference point.
989 The following communicative acts and macro acts are standard components of the FIPA agent
990 communication language. They are listed in alphabetical order. Communicative acts can be directly
991 performed, can be planned by an agent, and can be requested of one agent by another. Macro acts can be
992 planned and requested, but not directly performed.

993 **6.5.1 Preliminary notes**

994 The meanings of the communicative acts below frequently make reference to mental attitudes, such as belief,
995 intention or uncertainty. Whilst the formal semantics makes reference to formal operators which express
996 these concepts, a given agent implementation is not required to encode them explicitly, or to be founded on
997 any particular agent model (e.g. BDI). In the following narrative definitions:

998 *belief* means that, at least, the agent has a reasonable basis for stating the truth of a proposition, such as
999 having the proposition stored in a data structure or expressed implicitly in the construction of the agent
1000 software;

1001 *intention* means that the agent wishes some proposition, not currently believed to be true, to become true,
1002 and further that it will act in such a way that the truth of the proposition will be established. Again, this
1003 may not be represented explicitly in the agent⁴;

1004 *uncertain* means that the agent is not sure that a proposition is necessarily true, but it is more likely to be
1005 true than false. Believing a proposition and being uncertain of a proposition are mutually exclusive.

1006 For ease of reference, a synopsis formal description of each act is included with the narrative text. The
1007 meaning of the notation used may be found in §~~08~~

⁴ For instance, an agent which is constructed with a simple loop which receives requests for information and always answers them immediately, can be said to be expressing an intention to be helpful; in other words to ensure that other agents who need information it possesses do indeed gain that information.

1008 Formal basis of ACL semantics~~8~~

Formal basis of ACL semantics.

6.5.1.1 Category Index

The following table identifies the communicative acts in the catalogue by category. This is provided purely for ease of reference. Full descriptions of the messages can be found in the appropriate sections.

Table 222 — Categories of communicative acts

Communicative act	Information passing	Requesting information	Negotiation	Action performing	Error handling
accept-proposal			✓		
agree				✓	
cancel				✓	
cfp			✓		
confirm	✓				
disconfirm	✓				
failure					✓

6.5.2

1017

accept-proposal

Summary:	The action of accepting a previously submitted proposal to perform an action.
Message content:	A tuple, consisting of an action expression denoting the action to be done, and a proposition giving the conditions of the agreement.
Description:	<p><i>Accept-proposal</i> is a general-purpose acceptance of a proposal that was previously submitted (typically through a <i>propose</i> act). The agent sending the acceptance informs the receiver that it intends that (at some point in the future) the receiving agent will perform the action, once the given precondition is, or becomes, true.</p> <p>The proposition given as part of the acceptance indicates the preconditions that the agent is attaching to the acceptance. A typical use of this is to finalise the details of a deal in some protocol. For example, a previous offer to “hold a meeting anytime on Tuesday” might be accepted with an additional condition that the time of the meeting is 11.00.</p> <p>Note for future extension: an agent may intend that an action becomes done without necessarily intending the precondition. For example, during negotiation about a given task, the negotiating parties may not unequivocally intend their opening bids: agent a may bid a price p as a precondition, but be prepared to accept price p'.</p>
Summary Formal Model	<pre><i, accept-proposal(j, <j, act>,)> <i, inform(j, I; Done(<j, act>,))> FP : B_i B_i (Bif_j Uif_j) RE : B_j where = I_i Done(<j, act>,)</pre> <p><i>Note: this summary is included here for completeness. For full details, see §0Formal basis of ACL semantics.</i></p>
Example	<p>Agent i informs j that it accepts an offer from j to stream a given multimedia title to channel 19 when the customer is ready. Agent i will <i>inform</i> j of this fact when appropriate:</p> <pre>(accept-proposal :sender i :receiver j :in-reply-to bid089 :content ((action j (stream-content movie1234 19)) (B j (ready customer78))) :language sl)</pre>

1018

6.5.3

1019

agree

Summary:	The action of agreeing to perform some action, possibly in the future.
Message content:	A tuple, consisting of an agent identifier, an action expression denoting the action to be done, and a proposition giving the conditions of the agreement.
Description:	<p><i>Agree</i> is a general purpose agreement to a previously submitted <i>request</i> to perform some action. The agent sending the agreement informs the receiver that it does intend to perform the action, but not until the given precondition is true.</p> <p>The proposition given as part of the <i>agree</i> act indicates the qualifiers, if any, that the agent is attaching to the agreement. This might be used, for example, to inform the receiver when the agent will execute the action which it is agreeing to perform.</p> <p><i>Pragmatic note:</i> the precondition on the action being agreed to can include the perlocutionary effect of some other CA, such as an <i>inform</i> act. When the recipient of the agreement (e.g. a contract manager) wants the agreed action to be performed, it should then bring about the precondition by performing the necessary CA. This mechanism can be used to ensure that the contractor defers performing the action until the manager is ready for the action to be done.</p>
Summary Formal Model	<pre> <i, agree(j, <i, act>,)> <i, inform(j, I; Done(<i, act>,))> FP : B_i B_i (Bif_j Uif_j) RE : B_j where = I_i Done(<i, act>,) </pre> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>.</i></p>
Example	<p>Agent i (a job-shop scheduler) requests j (a robot) to deliver a box to a certain location. J answers that it agrees to the request but it has low priority.</p> <pre> (request :sender i :receiver j :content (action j (deliver box017 (location 12 19))) :protocol fipa-request :reply-with order567) (agree :sender j :receiver i :content ((deliver j box017 (location 12 19)) (priority order567 low)) :in-reply-to order567 :protocol fipa-request) </pre>

1020 **6.5.4**

1021 **cancel**

Summary:	The action of cancelling some previously <i>request</i> 'ed action which has temporal extent (i.e. is not instantaneous).
Message content:	An action expression denoting the action to be cancelled.
Description:	<p>Cancel allows an agent to stop another agent from continuing to perform (or expecting to perform) an action which was previously requested. Note that the action that is the object of the act of cancellation should be believed by the sender to be ongoing or to be planned but not yet executed.</p> <p>Attempting to <i>cancel</i> an action that has already been performed will result in a <i>refuse</i> message being sent back to the originator of the request.</p>
Summary Formal Model	<p><<i>i</i>, cancel(<i>j</i>, <i>a</i>)></p> <p><<i>i</i>, disconfirm(<i>j</i>, I_{<i>i</i>} Done(<i>a</i>))></p> <p>FP : I_{<i>i</i>} Done(<i>a</i>) B_{<i>i</i>} (B_{<i>j</i>} I_{<i>i</i>} Done(<i>a</i>) U_{<i>j</i>} I_{<i>i</i>} Done(<i>a</i>))</p> <p>RE : B_{<i>j</i>} I_{<i>i</i>} Done(<i>a</i>)</p> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>Formal basis of ACL semantics.</i></p>
Example	<p>Agent <i>j</i>₀ asks <i>i</i> to cancel a previous <i>request-whenever</i> by quoting the action:</p> <pre>(cancel :sender j0 :receiver i :content (request-whenever :sender j ...)))</pre> <p>Agent <i>j</i>₁ asks <i>i</i> to cancel an action by cross-referencing the previous conversation in which the request was made:</p> <pre>(cancel :sender j1 :receiver i :conversation-id cnv0087))</pre>

1022 **6.5.5**

1023

cfp

Summary:	The action of calling for proposals to perform a given action.
Message content:	A tuple containing an action expression denoting the action to be done and a proposition denoting the preconditions on the action.
Description:	<p><i>CFP</i> is a general-purpose action to initiate a negotiation process by making a call for proposals to perform the given action. The actual protocol under which the negotiation process is established is known either by prior agreement, or is explicitly stated in the <i>:protocol</i> parameter of the message.</p> <p>In normal usage, the agent responding to a <i>cfp</i> should answer with a proposition giving its conditions on the performance of the action. The responder's conditions should be compatible with the conditions originally contained in the <i>cfp</i>. For example, the <i>cfp</i> might seek proposals for a journey from Frankfurt to Munich, with a condition that the mode of travel is by train. A compatible proposal in reply would be for the 10.45 express train. An incompatible proposal would be to travel by 'plane.</p> <p>Note that <i>cfp</i> can also be used to simply check the availability of an agent to perform some action.</p>
Summary Formal Model	<p>$\langle i, \text{cfp}(j, \langle j, \text{act} \rangle, (x)) \rangle$</p> <p>$\langle i, \text{query-ref}(j, x \text{ (I}_i \text{ Done}(\langle j, \text{act} \rangle, (x)) \text{ (I}_j \text{ Done}(\langle j, \text{act} \rangle, (x)))) \rangle$</p> <p>FP : $\text{Bref}_i(x (x)) \quad \text{Uref}_i(x (x)) \quad \text{B}_i \text{ I}_j \text{ Done}(\langle j, \text{Inform-ref}(i, x (x)) \rangle)$</p> <p>RE : $\text{Done}(\langle j, \text{Inform}(i, x (x) = r_1) \rangle) \mid \dots \mid \langle j, \text{Inform}(i, x (x) = r_k) \rangle$</p> <p>where</p> <p>$(x) = \text{I}_i \text{ Done}(\langle j, \text{act} \rangle, (x)) \quad \text{I}_j \text{ Done}(\langle j, \text{act} \rangle, (x))$</p> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>.</i></p>
Example	<p>Agent j asks i to submit its proposal to sell 50 boxes of plums:</p> <pre>(cfp :sender j :receiver i :content ((action i (sell plum 50)) true) :ontology fruit-market)</pre>

1024

6.5.6

1025

confirm

Summary:	The sender informs the receiver that a given proposition is true, where the receiver is known to be uncertain about the proposition.
Message content:	A proposition
Description:	<p>The sending agent:</p> <ul style="list-style-type: none"> believes that some proposition is true intends that the receiving agent also comes to believe that the proposition is true believes that the receiver is <i>uncertain</i> of the truth of the proposition <p>The first two properties defined above are straightforward: the sending agent is sincere⁵, and has (somehow) generated the intention that the receiver should know the proposition (perhaps it has been asked). The last pre-condition determines when the agent should use <i>confirm</i> vs. <i>inform</i> vs. <i>disconfirm</i>: <i>confirm</i> is used precisely when the other agent is already known to be uncertain about the proposition (rather than <i>uncertain</i> about the negation of the proposition).</p> <p>From the receiver's viewpoint, receiving a <i>confirm</i> message entitles it to believe that:</p> <ul style="list-style-type: none"> the sender believes the proposition that is the content of the message the sender wishes the receiver to believe that proposition also. <p>Whether or not the receiver does, indeed, change its mental attitude to one of belief in the proposition will be a function of the receiver's trust in the sincerity and reliability of the sender.</p>
Summary Formal Model	<p>$\langle i, \text{confirm}(j, \) \rangle$</p> <p>FP: $B_i \quad B_i U_j$</p> <p>RE: B_j</p> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>Formal basis of ACL semantics.</i></p>
Examples	<p>Agent i confirms to agent j that it is, in fact, true that it is snowing today.</p> <pre>(confirm :sender i :receiver j :content "weather(today, snowing)" :language Prolog)</pre>

1026

6.5.7

⁵ Arguably there are situations where an agent might not want to be sincere, for example to protect confidential information. We consider these cases to be beyond the current scope of this specification.

1027

disconfirm

Summary:	The sender informs the receiver that a given proposition is false, where the receiver is known to believe, or believe it likely that, the proposition is true.
Message content:	A proposition
Description:	<p>The disconfirm act is used when the agent wishes to alter the known mental attitude of another agent.</p> <p>The sending agent:</p> <ul style="list-style-type: none"> believes that some proposition is false intends that the receiving agent also comes to believe that the proposition is false believes that the receiver either believes the proposition, or is <i>uncertain</i> of the proposition. <p>The first two properties defined above are straightforward: the sending agent is sincere (<i>note 5</i>), and has (somehow) generated the intention that the receiver should know the proposition (perhaps it has been asked). The last pre-condition determines when the agent should use <i>confirm</i>, <i>inform</i> or <i>disconfirm</i>: <i>disconfirm</i> is used precisely when the other agent is already known to believe the proposition or to be uncertain about it.</p> <p>From the receiver's viewpoint, receiving a <i>disconfirm</i> message entitles it to believe that:</p> <ul style="list-style-type: none"> the sender believes that the proposition that is the content of the message is false; the sender wishes the receiver to believe the negated proposition also. <p>Whether or not the receiver does, indeed, change its mental attitude to one of disbelief in the proposition will be a function of the receiver's trust in the sincerity and reliability of the sender.</p>
Summary Formal Model	<p>$\langle i, \text{disconfirm}(j, \text{ }) \rangle$</p> <p>FP: $B_i \quad B_i(U_j \quad B_j)$</p> <p>RE: B_j</p> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>Formal basis of ACL semantics.</i></p>
Example	<p>Agent <i>i</i>, believing that agent <i>j</i> thinks that a shark is a mammal, attempts to change <i>j</i>'s belief:</p> <pre>(disconfirm :sender i :receiver j :content (mammal shark))</pre>

1028

6.5.8

1029 **failure**

Summary:	The action of telling another agent that an action was attempted but the attempt failed.
Message content:	A tuple, consisting of an action expression and a proposition giving the reason for the failure.
Description:	<p>The failure act is an abbreviation for informing that an act was considered feasible by the sender, but was not completed for some given reason. The agent receiving a failure act is entitled to believe that:</p> <ul style="list-style-type: none"> the action has not been done the action is (or, at the time the agent attempted to perform the action, was) feasible <p>The (causal) reason for the refusal is represented by the proposition, which is the third term of the tuple. It may be the constant <i>true</i>. There is no guarantee that the reason is represented in a way that the receiving agent will understand: it could be a textual error message. Often it is the case that there is little either agent can do to further the attempt to perform the action.</p>
Summary Formal Model	<p>$\langle i, failure(j, a, \) \rangle$</p> <p>$\langle i, inform(j, (e) Single(e) Done(e, Feasible(a) I_i Done(a)) Done(a) I_i Done(a)) \rangle$</p> <p>FP : B_i $B_i (Bif_j \ Uif_j \)$</p> <p>RE : B_j</p> <p>where</p> <p>$= (e) Single(e) Done(e, Feasible(a) I_i Done(a)) Done(a) I_i$</p> <p><i>Note: this summary is included here for completeness. For full details, see §0</i><u>Formal basis of ACL semantics</u><i>Formal basis of ACL semantics.</i></p>
Example	<p>Agent j informs i that it has failed to open a file:</p> <pre>(failure :sender j :receiver i :content ((action j "open(\"foo.txt\")") (error-message "No such file: foo.txt")) :language sl)</pre>

1030 **6.5.9**

1031

inform

Summary:	The sender informs the receiver that a given proposition is true.
Message content:	A proposition
Description:	<p>The sending agent:</p> <ul style="list-style-type: none"> holds that some proposition is true; intends that the receiving agent also comes to believe that the proposition is true; does not already believe that the receiver has any knowledge of the truth of the proposition. <p>The first two properties defined above are straightforward: the sending agent is sincere, and has (somehow) generated the intention that the receiver should know the proposition (perhaps it has been asked). The last property is concerned with the semantic soundness of the act. If an agent knows already that some state of the world holds (that the receiver knows proposition <i>p</i>), it cannot rationally adopt an intention to bring about that state of the world (i.e. that the receiver <i>comes to know p</i> as a result of the inform act). Note that the property is not as strong as it perhaps appears. The sender <i>is not</i> required to <i>establish</i> whether the receiver knows <i>p</i>. It is only the case that, in the case that the sender already happens to know about the state of the receiver's beliefs, it should not adopt an intention to tell the receiver something it already knows. From the receiver's viewpoint, receiving an inform message entitles it to believe that:</p> <ul style="list-style-type: none"> the sender believes the proposition that is the content of the message the sender wishes the receiver to believe that proposition also. <p>Whether or not the receiver does, indeed, adopt belief in the proposition will be a function of the receiver's trust in the sincerity and reliability of the sender.</p>
Summary Formal Model	<p>$\langle i, \text{inform}(j, \) \rangle$</p> <p>FP: $B_i \quad B_i(B_{if_j} \quad U_{if_j})$</p> <p>RE: B_j</p> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>.</i></p>
Examples	<p>Agent <i>i</i> informs agent <i>j</i> that (it is true that) it is raining today:</p> <pre>(inform :sender i :receiver j :content "weather(today, raining)" :language Prolog)</pre>

1032

6.5.10

1033

inform-if (macro act)

Summary:	A macro action for the agent of the action to inform the recipient whether or not a proposition is true.
Message content:	A proposition.
Description:	<p>The <i>inform-if</i> macro act is an abbreviation for informing whether or not a given proposition is believed. The agent which enacts an <i>inform-if</i> macro-act will actually perform a standard <i>inform</i> act. The content of the inform act will depend on the informing agent's beliefs. To <i>inform-if</i> on some closed proposition :</p> <p style="padding-left: 40px;">if the agent believes the proposition, it will inform the other agent that if it believes the negation of the proposition, it informs that is false (i.e.)</p> <p>Under other circumstances, it may not be possible for the agent to perform this plan. For example, if it has no knowledge of , or will not permit the other party to know (that it believes) , it will send a <i>refuse</i> message.</p>
Summary Formal Model	<p>$i, \text{inform-if}(j,) >$ $<i, \text{inform}(j,) > <i, \text{inform}(j,) >$ FP : B_i $B_i (B_i j \quad U_i j)$ RE : $B_i j$</p> <p><i>Note: this summary is included here for completeness. For full details, see §0Format basis of ACL semantics</i> Formal basis of ACL semantics.</p>
Examples	<p>Agent i requests j to inform it whether Lannion is in Normandy:</p> <pre>(request :sender i :receiver j :content (inform-if :sender j :receiver i :content "in(lannion, normandy)" :language Prolog) :language sl)</pre> <p>Agent j replies that it is not:</p> <pre>(inform :sender j :receiver i :content "\+ in(lannion, normandy)" :language Prolog)</pre>

1034

6.5.11

1035

inform-ref (macro act)

Summary:	A macro action for sender to inform the receiver the object which corresponds to a definite descriptor (e.g. a name).
Message content:	An object description.
Description:	<p>The <i>inform-ref</i> macro action allows the sender to inform the receiver some object that the sender believes corresponds to a definite descriptor, such as a name or other identifying description.</p> <p><i>Inform-ref</i> is a macro action, since it corresponds to a (possibly infinite) disjunction of <i>inform</i> acts, each of which informs the receiver that “the object corresponding to <i>name</i> is <i>x</i>” for some given <i>x</i>. For example, an agent can plan an <i>inform-ref</i> of the current time to agent <i>j</i>, and then perform the act “<i>inform j</i> that the time is 10.45”.</p> <p>The agent performing the act should believe that the object corresponding to the definite descriptor is the one that is given, and should not believe that the recipient of the act already knows this. The agent may elect to send a <i>refuse</i> message if it is unable to establish the preconditions of the act.</p>
Summary Formal Model	<p>$\langle i, \text{inform-ref}(j, x(x)) \rangle$</p> <p>$\langle i, \text{Inform}(j, x(x) = r_1) \rangle \dots \langle i, \text{Inform}(j, x(x) = r_k) \rangle$</p> <p>FP: $Bref_j x(x) \quad B_i(Bref_j x(x) \quad Uref_j x(x))$</p> <p>RE: $Bref_j x(x)$</p> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>Formal basis of ACL semantics.</i></p>
Example	<p>Agent <i>i</i> requests <i>j</i> to tell it the current Prime Minister of the United Kingdom:</p> <pre>(request :sender i :receiver j :content (inform-ref :sender j :receiver i :content (iota ?x (UKPrimeMinister ?x)) :ontology world-politics :language sl) :reply-with query0 :language sl)</pre> <p>Agent <i>j</i> replies:</p> <pre>(inform :sender j :receiver i :content (= (iota ?x (UKPrimeMinister ?x)) "Tony Blair") :ontology world-politics :in-reply-to query0)</pre> <p>Note that a standard abbreviation for the <i>request</i> of <i>inform-ref</i> used in this example is the act <i>query-ref</i>.</p>

1036 **6.5.12**

1037

not-understood

Summary:	The sender of the act (e.g. i) informs the receiver (e.g. j) that it perceived that j performed some action, but that i did not understand what j just did. A particular common case is that i tells j that i did not understand the message that j has just sent to i.
Message content:	A tuple consisting of an action or event (e.g. a communicative act) and an explanatory reason.
Description:	<p>The sender received a communicative act which it did not understand. There may be several reasons for this: the agent may not have been designed to process a certain act or class of acts, or it may have been expecting a different message. For example, it may have been strictly following a pre-defined protocol, in which the possible message sequences are predetermined. The <i>not-understood</i> message indicates to that the sender of the original (i.e. misunderstood) action that nothing has been done as a result of the message. This act may also be used in the general case for i to inform j that it has not understood j's action.</p> <p>The second term of the content tuple is a proposition representing the reason for the failure to understand. There is no guarantee that the reason is represented in a way that the receiving agent will understand: it could be a textual error message. However, a co-operative agent will attempt to explain the misunderstanding constructively</p>
Summary Formal Model	$\langle i, \text{not-understood}(j, a) \rangle$ $\langle i, \text{Inform}(j, (x) B_i((e \text{ Done}(e) \text{ Agent}(e, j) B_j(\text{Done}(e) \text{ Agent}(e, j) (a = e))) = x)) \rangle$ $\text{FP} : B_i \quad B_i(Bif_j \quad Uif_j)$ $\text{RE} : B_j$ <p>where</p> $= (x) B_i((e \text{ Done}(e) \text{ Agent}(e, j) B_j(\text{Done}(e) \text{ Agent}(e, j) (a = e))) = x)$ <p><i>Note: this summary is included here for completeness. For full details, see §0Formal basis of ACL semantics.</i></p>
Examples	<p>Agent i did not understand an query-if message because it did not recognise the ontology:</p> <pre>(not-understood :sender i :receiver j :content ((query-if :sender j :receiver i ...) (unknown (ontology www))) :language sl)</pre>

1038

6.5.13

1039

propose

Summary:	The action of submitting a proposal to perform a certain action, given certain preconditions.
Message content:	A tuple containing an action description, representing the action that the sender is proposing to perform, and a proposition representing the preconditions on the performance of the action.
Description:	<p><i>Propose</i> is a general-purpose action to make a proposal or respond to an existing proposal during a negotiation process by proposing to perform a given action subject to certain conditions being true. The actual protocol under which the negotiation process is being conducted is known either by prior agreement, or is explicitly stated in the <i>:protocol</i> parameter of the message. The proposer (the sender of the <i>propose</i>) informs the receiver that the proposer will adopt the intention to perform the action once the given precondition is met, and the receiver notifies the proposer of the receiver's intention that the proposer performs the action.</p> <p>A typical use of the condition attached to the proposal is to specify the price of a bid in an auctioning or negotiation protocol.</p>
Summary Formal Model	<p>$\langle i, \text{propose}(j, \langle i, \text{act} \rangle,) \rangle$ $\langle i, \text{inform}(j, I_j \text{ Done}(\langle i, \text{act} \rangle,) \quad I_i \text{ Done}(\langle i, \text{act} \rangle,)) \rangle$ FP : $B_i \quad B_i (Bif_j \quad Uif_j)$ RE : B_j</p> <p>where</p> <p>$= I_j \text{ Done}(\langle i, \text{act} \rangle,) \quad I_i \text{ Done}(\langle i, \text{act} \rangle,)$</p> <p><i>Note: this summary is included here for completeness. For full details, see §0Formal basis of ACL semanticsFormal basis of ACL semantics.</i></p>
Example	<p>Agent j informs i that it will sell 50 boxes of plums for \$200:</p> <pre>(propose :sender j :receiver i :content ((action j (sell plum 50))(cost 200)) :ontology fruit-market :in-reply-to proposal2 :language sl ...)</pre>

1040

6.5.14

1041

query-if

Summary:	The action of asking another agent whether or not a given proposition is true.
Message content:	A proposition.
Description:	<p><i>Query-if</i> is the act of asking another agent whether (it believes that) a given proposition is true. The sending agent is requesting the receiver to <i>inform</i> it of the truth of the proposition.</p> <p>The agent performing the <i>query-if</i> act:</p> <ul style="list-style-type: none"> has no knowledge of the truth value of the proposition believes that the other agent does know the truth of the proposition.
Summary Formal Model	<p>$\langle i, \text{query-if}(j, \) \rangle$ $\langle i, \text{request}(j, \langle j, \text{inform-if}(i, \) \rangle) \rangle$ FP: $B_i j \quad U_i j \quad B_j I_j \text{ Done}(\langle j, \text{inform-if}(i, \) \rangle)$ RE: $\text{Done}(\langle j, \text{inform}(i, \) \rangle \langle j, \text{inform}(i, \) \rangle)$</p> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>Formal basis of ACL semantics.</i></p>
Example	<p>Agent i asks agent j if j is registered with domain server d1:</p> <pre>(query-if :sender i :receiver j :content (registered (server d1) (agent j)) :reply-with r09 ...)</pre> <p>Agent j replies that it is not:</p> <pre>(inform :sender j :receiver i :content (not (registered (server d1) (agent j))) :in-reply-to r09)</pre>

1042

6.5.15

1043

query-ref

Summary:	The action of asking another agent for the object referred to by an expression.
Message content:	A definite descriptor
Description:	<p><i>Query-ref</i> is the act of asking another agent to inform the requestor of the object identified by a definite descriptor. The sending agent is requesting the receiver to perform an <i>inform</i> act, containing the object that corresponds to the definite descriptor.</p> <p>The agent performing the <i>query-ref</i> act:</p> <ul style="list-style-type: none"> does not know which object corresponds to the descriptor believes that the other agent does know which object corresponds to the descriptor.
Summary Formal Model	<p>$\langle i, \text{query-ref}(j, x(x))$ $\langle i, \text{request}(j, \langle j, \text{inform-ref}(i, x(x)) \rangle) \rangle$ FP: $Bref_i(x(x)) \quad Uref_i(x(x)) \quad B_j I_j Done(\langle j, \text{inform-ref}(i, x(x)) \rangle)$ RE: $Done(\langle i, \text{Inform}(j, x(x) = r_1) \rangle) \dots \langle i, \text{Inform}(j, x(x) = r_k) \rangle)$</p> <p><i>Note: this summary is included here for completeness. For full details, see §0 Formal basis of ACL semantics.</i></p>
Example	<p>Agent i asks agent j for its available services:</p> <pre>(query-ref :sender i :receiver j :content (iota ?x (available-services j ?x)) ...)</pre> <p>j replies that it can reserve trains, planes and automobiles:</p> <pre>(inform :sender j :receiver i :content (= (iota ?x (available-services j ?x)) ((reserve-ticket train) (reserve-ticket plane) (reserve automobile))) ...)</pre>

1044

6.5.16

1045

refuse

Summary:	The action of refusing to perform a given action, and explaining the reason for the refusal.
Message content:	A tuple, consisting of an action expression and a proposition giving the reason for the refusal.
Description:	<p>The refuse act is an abbreviation for denying (strictly speaking, <i>disconfirming</i>) that an act is possible for the agent to perform, and stating the reason why that is so.</p> <p>The refuse act is performed when the agent cannot meet all of the preconditions for the action to be carried out, both implicit and explicit. For example, the agent may not know something it is being asked for, or another agent requested an action for which it has insufficient privilege.</p> <p>The agent receiving a refuse act is entitled to believe that:</p> <ul style="list-style-type: none"> the action has not been done the action is not feasible (from the point of view of the sender of the refusal) the (causal) reason for the refusal is represented by the a proposition which is the third term of the tuple, (which may be the constant true). <p>There is no guarantee that the reason is represented in a way that the receiving agent will understand: it could be a textual error message. However, a co-operative agent will attempt to explain the refusal constructively.</p>
Summary Formal Model	<pre> <i, refuse(j, <i, act>,)> <i, disconfirm(j, Feasible(<i, act>))>; <i, inform(j, Done(<i, act>) I_i Done(<i, act>))> FP : B_i Feasible(<i, act>) B_i (B_j Feasible(<i, act>) U_j Feasible(<i, act>)) B_i B_i (B_if_j U_if_j) RE : B_j Feasible(<i, act>) B_j where = Done(<i, act>) I_i Done(<i, act>) </pre> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>Formal basis of ACL semantics.</i></p>
Example	<p>Agent j refuses to i reserve a ticket for i, since i there are insufficient funds in i's account:</p> <pre> (refuse :sender j :receiver i :content ((action j (reserve-ticket LHR, MUC, 27-sept- 97)) (insufficient-funds ac12345)) :language sl) </pre>

1046 **6.5.17**

1047

reject-proposal

Summary:	The action of rejecting a proposal to perform some action during a negotiation.
Message content:	A tuple consisting of an action description and a proposition which formed the original proposal being rejected, and a further proposition which denotes the reason for the rejection.
Description:	<p><i>Reject-proposal</i> is a general-purpose rejection to a previously submitted proposal. The agent sending the rejection informs the receiver that it has no intention that the recipient performs the given action under the given preconditions.</p> <p>The additional proposition represents a reason that the proposal was rejected. Since it is in general hard to relate cause to effect, the formal model below only notes that the reason proposition was believed true by the sender at the time of the rejection. Syntactically the reason on the lhs should be treated as a causal explanation for the rejection, even though this is not established by the formal semantics.</p>
Summary Formal Model	<pre> <i, reject-proposal(j, <j, act>, ,)> <i, inform(j, I_jDone(<j, act>,))> FP : B_i B_i (Bif_j Uif_j) RE : B_j where = I_jDone(<j, act>,) </pre> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>.</i></p>
Example	<pre> Agent i informs j that it rejects an offer from j to sell (reject-proposal :sender i :receiver j :content ((action j (sell plum 50)) (price-too-high 50)) :in-reply-to proposal13) </pre>

1048

6.5.18

1049 **request**

Summary:	The sender requests the receiver to perform some action. One important class of uses of the request act is to request the receiver to perform another communicative act.
Message content:	An action description.
Description:	The sender is requesting the receiver to perform some action. The content of the message is a description of the action to be performed, in some language the receiver understands. The action can be any action the receiver is capable of performing: pick up a box, book a plane flight, change a password etc. An important use of the request act is to build composite conversations between agents, where the actions that are the object of the request act are themselves communicative acts such as <i>inform</i> .
Summary Formal Model	$\langle i, \text{request}(j, a) \rangle$ FP: $\text{FP}(a) [i j] \quad B_i \text{Agent}(j, a) \quad B_i I_j \text{Done}(a)$ RE: $\text{Done}(a)$ <i>Note: this summary is included here for completeness. For full details, see §0</i> Formal basis of ACL semantics <i>Formal basis of ACL semantics.</i>
Examples	Agent i requests j to open a file: <pre>(request :sender i :receiver j :content "open \"db.txt\" for input" :language vb)</pre>

1050 **6.5.19**

1051 **request-when**

Summary:	The sender wants the receiver to perform some action when some given proposition becomes true.
Message content:	A tuple of an action description and a proposition.
Description:	<p><i>Request-when</i> allows an agent to inform another agent that a certain action should be performed as soon as a given precondition, expressed as a proposition, becomes true.</p> <p>The agent receiving a <i>request-when</i> should either refuse to take on the commitment, or should arrange to ensure that the action will be performed when the condition becomes true. This commitment will persist until such time as it is discharged by the condition becoming true, the requesting agent <i> Cancels</i> the <i>request-when</i>, or the agent decides that it can no longer honour the commitment, in which case it should send a <i>refuse</i> message to the originator. No specific commitment is implied by the specification as to how frequently the proposition is re-evaluated, nor what the lag will be between the proposition becoming true and the action being enacted. Agents which require such specific commitments should negotiate their own agreements prior to submitting the <i>request-when</i> act.</p>
Summary Formal Model	<pre> <i, request-when(j, <j, act>,)> <i, inform(j, (e') Done(e') Unique(e') I_j Done(<j, act>, (e) Enables(e, B_j) Has-never-held-since(e', B_j)))> FP : B_i B_i (Bif_j Uif_j) RE : B_j where = (e') Done(e') (Unique(e') I_j Done(<j, act>, (e) Enables(e, B_j) Has-never-held-since(e', B_j)) </pre> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>Formal basis of ACL semantics.</i></p>
Examples	<p>Agent i tells agent j to notify it as soon as an alarm occurs.</p> <pre> (request-when :sender i :receiver j :content ((inform :sender j :receiver i :content "something alarming!") (Done(alarm))) ...) </pre>

1052 **6.5.20**

1053

request-whenEVER

<p>Summary:</p>	<p>The sender wants the receiver to perform some action as soon as some proposition becomes true and thereafter each time the proposition becomes true again.</p>
<p>Message content:</p>	<p>A tuple of an action description and a proposition.</p>
<p>Description:</p>	<p><i>Request-whenEVER</i> allows an agent to inform another agent that a certain action should be performed as soon as a given precondition, expressed as a proposition, becomes true, and that, furthermore, if the proposition should subsequently become false, the action will be repeated as soon as it once more becomes true.</p> <p><i>Request-whenEVER</i> represents a persistent commitment to re-evaluate the given proposition and take action when its value changes. The originating agent may subsequently remove this commitment by performing the <i>cancel</i> action. No specific commitment is implied by the specification as to how frequently the proposition is re-evaluated, nor what the lag will be between the proposition becoming true and the action being enacted. Agents who require such specific commitments should negotiate their own agreements prior to submitting the <i>request-when</i> act.</p>
<p>Summary Formal Model</p>	<p>$\langle i, \text{request-whenEVER}(j, \langle j, \text{act} \rangle,) \rangle$ $\langle i, \text{inform}(j, I_i \text{Done}(\langle j, \text{act} \rangle, (e) \text{Enables}(e, B_j))) \rangle$</p> <p>FP : B_i $B_i (B_i f_j \quad U_i f_j)$ RE : B_j</p> <p>where</p> <p>$= I_i \text{Done}(\langle j, \text{act} \rangle, (e) \text{Enables}(e, B_j))$</p> <p><i>Note: this summary is included here for completeness. <p>Examples</p>	<p>Agent i tells agent j to notify it whenever the price of widgets rises from less than 50 to more than 50.</p> <pre>(request-whenEVER :sender i :receiver j :content ((inform :sender j :receiver i :content (price widget)) (> (price widget) 50)) ...)</pre>

1054

6.5.20

1055 **request-whomever**

Summary:	The sender wants an action performed by some agent other than itself. The receiving agent should either perform the action or pass it on to some other agent.
Message content:	A tuple of an action description and a proposition.
Description:	<p><i>Request-whomever</i> allows for brokering actions. an agent to inform another agent that a certain action should be performed as soon as a given precondition, expressed as a proposition, becomes true, and that, furthermore, if the proposition should subsequently become false, the action will be repeated as soon as it once more becomes true.</p> <p><i>Request-whenever</i> represents a persistent commitment to re-evaluate the given proposition and take action when its value changes. The originating agent may subsequently remove this commitment by performing the <i>cancel</i> action. No specific commitment is implied by the specification as to how frequently the proposition is re-evaluated, nor what the lag will be between the proposition becoming true and the action being enacted. Agents who require such specific commitments should negotiate their own agreements prior to submitting the <i>request-when</i> act.</p>
Summary Formal Model	<p>$\langle i, \text{request-whenever}(j, \langle j, \text{act} \rangle,) \rangle$ $\langle i, \text{inform}(j, I_i \text{Done}(\langle j, \text{act} \rangle, (e) \text{Enables}(e, B_j)) \rangle \rangle$</p> <p>FP : B_i $B_i (B_i f_j \quad U_i f_j)$ RE : B_j</p> <p>where</p> <p>$= I_i \text{Done}(\langle j, \text{act} \rangle, (e) \text{Enables}(e, B_j))$</p> <p><i>Note: this summary is included here for completeness. For full details, see §0</i>Formal basis of ACL semantics<i>.</i></p>
Examples	<p>Agent i tells agent j to notify it whenever the price of widgets rises from less than 50 to more than 50.</p> <pre>(request-whenever :sender i :receiver j :content ((inform :sender j :receiver i :content (price widget)) (> (price widget) 50)) ...)</pre>

1056 **6.5.21**

1057

subscribe

Summary:	The act of requesting a persistent intention to notify the sender of the value of a reference, and to notify again whenever the object identified by the reference changes.
Message content:	A definite descriptor
Description:	The <i>subscribe</i> act is a persistent version of <i>query-ref</i> , such that the agent receiving the <i>subscribe</i> will <i>inform</i> the sender of the value of the reference, and will continue to send further <i>informs</i> if the object denoted by the definite description changes. A subscription set up by a <i>subscribe</i> act is terminated by a <i>cancel</i> act.
Summary Formal Model	$\langle i, \text{subscribe}(j, x(x)) \rangle$ $\langle i, \text{request-when-ever}(j, \langle j, \text{inform-ref}(i, x(x)) \rangle, (y) B_j((x(x) = y))) \rangle$ $\text{FP} : B_i \quad B_i (B_i f_j \quad U_i f_j)$ $\text{RE} : B_j$ where $= I_i \text{ Done}(\langle j, \text{inform-ref}(i, x(x)) \rangle, (e) \text{ Enables}(e, (y) B_j((x(x) = y))))$ <i>Note: this summary is included here for completeness. For full details, see §0</i> Formal basis of ACL semantics <i>Formal basis of ACL semantics.</i>
Examples	Agent <i>i</i> wishes to be updated on the exchange rate of Francs to Dollars, and makes a subscription agreement with <i>j</i> (an exchange rate server): <pre>(subscribe :sender i :receiver j: :content (iota ?x (= ?x (xch-rate FFr USD))))</pre>

1059 Interaction Protocols

1060 Ongoing conversations between agents often fall into typical patterns. In such cases, certain message
 1061 sequences are expected, and, at any point in the conversation, other messages are expected to follow. These
 1062 typical patterns of message exchange are called *protocols*. A designer of agent systems has the choice to
 1063 make the agents sufficiently aware of the meanings of the messages, and the goals, beliefs and other mental
 1064 attitudes the agent possesses, that the agent's planning process causes such protocols to arise spontaneously
 1065 from the agents' choices. This, however, places a heavy burden of capability and complexity on the agent
 1066 implementation, though it is not an uncommon choice in the agent community at large. An alternative, and
 1067 very pragmatic, view is to pre-specify the protocols, so that a simpler agent implementation can nevertheless
 1068 engage in meaningful conversation with other agents, simply by carefully following the known protocol.
 1069 This section of the specification details a number of such protocols, in order to facilitate the effective inter-
 1070 operation of simple and complex agents. No claim is made that this is an exhaustive list of useful protocols,
 1071 nor that they are necessary for any given application. The protocols are given pre-defined names: the
 1072 requirement for adhering to the specification is:

Requirement 8:

An ACL compliant agent need not implement any of the standard protocols, nor is it restricted from using other protocol names. However, if one of the standard protocol names is used, the agent must behave consistently with the protocol specification given here.

1073 Note that, by their nature, agents can engage in multiple dialogues, perhaps with different agents,
 1074 simultaneously. The term *conversation* is used to denote any particular instance of such a dialogue. Thus, the
 1075 agent may be concurrently engaged in multiple conversations, with different agents, within different
 1076 protocols. The remarks in this section which refer to the receipt of messages under the control of a given
 1077 protocol refer only to a particular conversation.

1078 7.1 Specifying when a protocol is in operation

1079 Notionally, two agents intending to use a protocol should first negotiate whether to use a protocol, and, if so,
 1080 which one. However, providing the mechanism to do this would negate a key purpose of protocols, which is
 1081 to simplify the agent implementation. The following convention is therefore adopted: placing the name of the
 1082 protocol that is being used in the *:protocol* parameter of a message is equivalent to (and slightly more
 1083 efficient than) prepending with an *inform* that i intends that the protocol will be done (i.e., formally, $I_i \text{ Done}(\text{protocol-name})$). Once the protocol is finished, which may occur when one of the final states of the protocol is reached, or when the name of the protocol is dropped from the *:protocol* parameter of the message, this implicit intention has been satisfied.

1087 If the agent receiving a message in the context of a protocol which it cannot, or does not wish to, support, it
 1088 should send back a *refuse* message explaining this.

1089 Example:

```
1090     (request :sender i
1091           :receiver j
1092           :content some-act
1093           :protocol fipa-request
1094     )
```

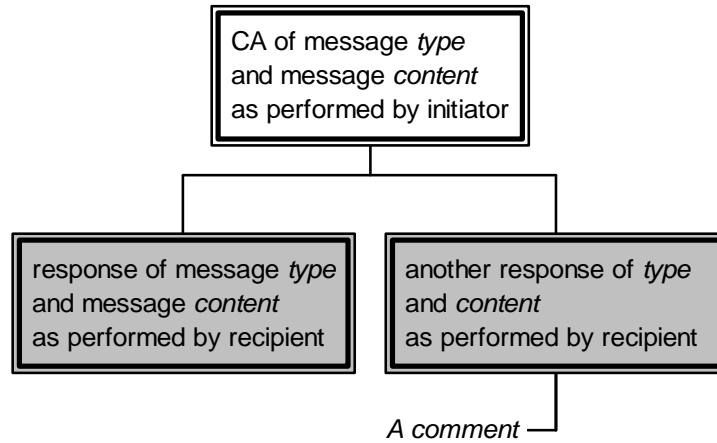

1096 7.2 Protocol Description Notation

1097 The following notation is used to describe the standard interaction protocols in a convenient manner:

1098 Boxes with double edges represent communicative actions.

1099 White boxes represent actions performed by initiator.

1100 Shaded boxes are performed by the other participant(s) in the protocol.
 1101 *Italicised text* with no box represents a comment.
 1102

1103
 1104 **Figure 222** — Example of graphical description of protocols

1105 The above notation is meant solely to represent the protocol as it might be seen by an outside observer. In
 1106 particular, only those actions should be depicted which are explicit objects of conversation. Actions which
 1107 are internal to an agent in order to execute the protocol are not represented as this may unduly restrict an
 1108 agent implementation (e.g. it is of no concern how an agent arrives at a proposal).

1109
 1110 **7.3 Defined protocols**

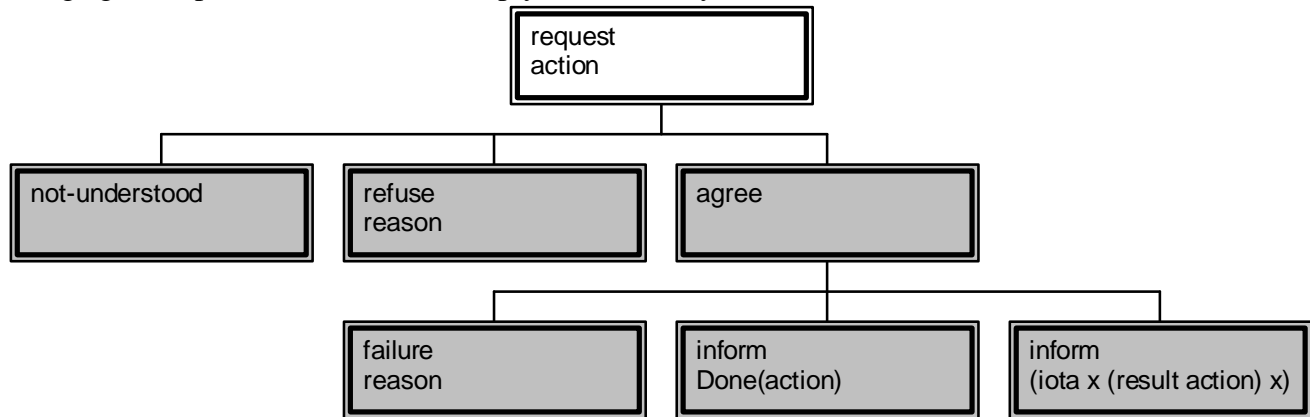

1111 **7.3.1 Failure to understand a response during a protocol**

1112 Whilst not, strictly speaking, a protocol, by convention an agent which is expecting a certain set of responses
 1113 in a protocol, and which receives another message not in that set, should respond with a *not-understood*
 1114 message.

1115 To guard against the possibility of infinite message loops, it is not permissible to respond to a *not-understood*
 1116 message with another *not-understood* message!

1117 **7.3.2 FIPA-request Protocol**

1118 The FIPA-request protocol simply allows one agent to request another to perform some action, and the
 1119 receiving agent to perform the action or reply, in some way, that it cannot.

1120
 1121 **Figure 333** — FIPA-Request Protocol

7.3.3 FIPA-query Protocol

In the FIPA-query protocol, the receiving agent is requested to perform some kind of inform action. Requesting to inform is a query, and there are two query-acts: query-if and query-ref. Either act may be used to initiate this protocol. If the protocol is initiated by a query-if act, it the responder will plan to return the answer to the query with a normal inform act. If initiated by query-ref, it will instead be an inform-ref that is planned. Note that, since inform-ref is a macro act, it will in fact be an inform act that is in fact carried out by the responder.

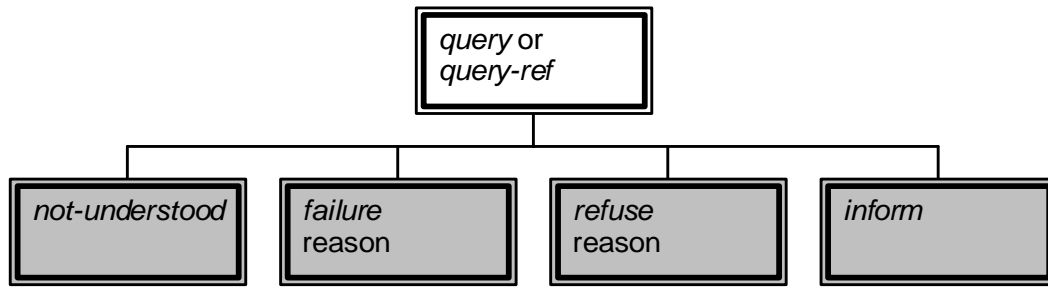

Figure 444 — FIPA-Query Protocol

7.3.4 FIPA-request-when Protocol

The FIPA-request-when protocol is simply an expression of the full intended meaning of the request-when action. The requesting agent uses the *request-when* action to seek from the requested agent that it performs some action in the future once a given precondition becomes true. If the requested agent understands the request and does not refuse, it will wait until the precondition occurs then perform the action, after which it will notify the requester that the action has been performed. Note that this protocol is somewhat redundant in the case that the action requested involves notifying the requesting agent anyway. If it subsequently becomes impossible for the requested agent to perform the action, it will send a refuse request to the original requestor.

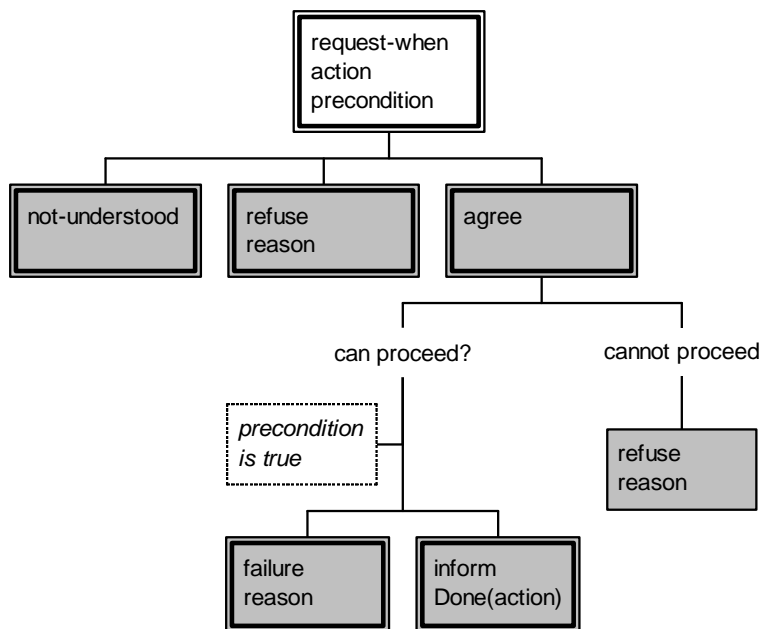

Figure 555 — FIPA-request-when protocol

7.3.5 FIPA-contract-net Protocol

This section presents a version of the widely used *Contract Net Protocol*, originally developed by Smith and Davis [Smith & Davis 80]. FIPA-Contract-Net is a minor modification of the original contract net protocol in that it adds *rejection* and *confirmation* communicative acts. In the contract net protocol, one agent takes the role of *manager*. The manager wishes to have some task performed by one or more other agents, and further wishes to optimise a function that characterises the task. This characteristic is commonly expressed as the *price*, in some domain specific way, but could also be soonest time to completion, fair distribution of tasks, etc.

The manager solicits *proposals* from other agents by issuing a *call for proposals*, which specifies the task and any conditions the manager is placing upon the execution of the task. Agents receiving the call for proposals are viewed as potential *contractors*, and are able to generate proposals to perform the task as *propose* acts. The contractor's proposal includes the preconditions that the contractor is setting out for the task, which may be the price, time when the task will be done, etc. Alternatively, the contractor may *refuse* to propose. Once the manager receives back replies from all of the contractors, it evaluates the proposals and makes its choice of which agents will perform the task. One, several, or no agents may be chosen. The agents of the selected proposal(s) will be sent an acceptance message, the others will receive a notice of rejection. The proposals are assumed to be binding on the contractor, so that once the manager accepts the proposal the contractor acquires a commitment to perform the task. Once the contractor has completed the task, it sends a completion message to the manager.

Note that the protocol requires the manager to know when it has received all replies. In the case that a contractor fails to reply with either a *propose* or a *refuse*, the manager may potentially be left waiting indefinitely. To guard against this, the *cfp* includes a deadline by which replies should be received by the manager. Proposals received after the deadline are automatically rejected, with the given reason that the proposal was late.

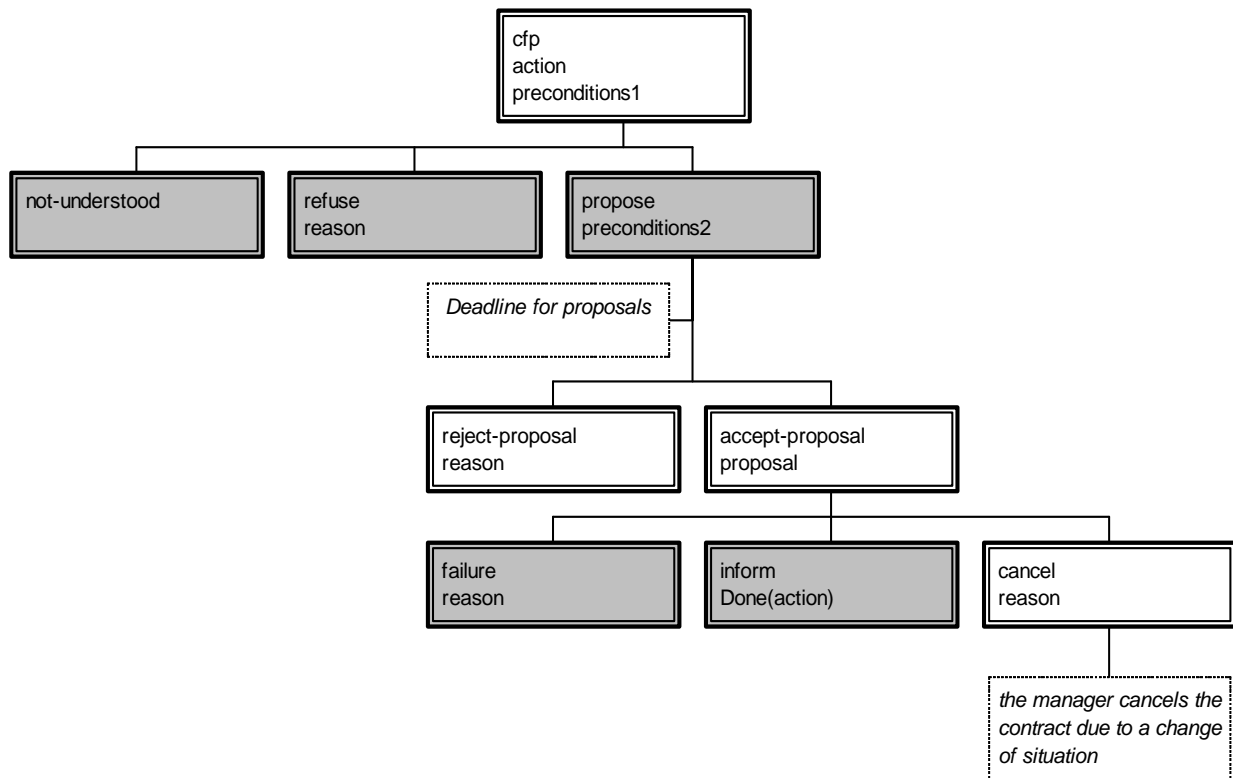

Figure 666 — FIPA-Contract-Net

7.3.6 FIPA-Iterated-Contract-Net Protocol

The *iterated contract net* protocol is an extension of the basic contract net as described above. It differs from the basic version of the contract net by allowing multi-round iterative bidding. As above, the manager issues the initial call for proposals with the *cfp* act. The contractors then answer with their bids as *propose* acts. The manager may then accept one or more of the bids, rejecting the others, or may iterate the process by issuing a revised *cfp*. The intent is that the manager seeks to get better bids from the contractors by modifying the call and requesting new (equivalently, revised) bids. The process terminates when the manager refuses all proposals and does not issue a new call, accepts one or more of the bids, or the contractors all refuse to bid.

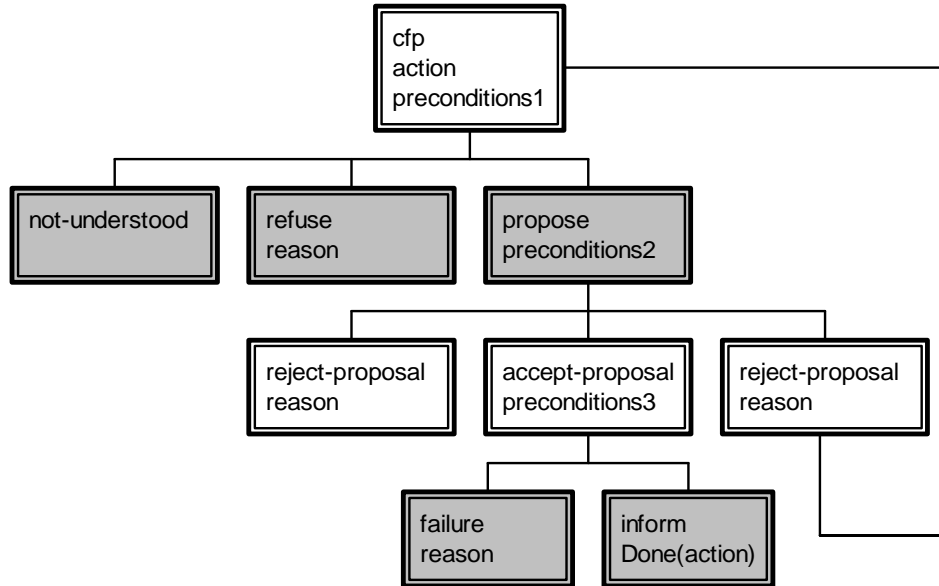

Figure 7.7 — FIPA-iterated-contract-net protocol

7.3.7 FIPA-Auction-English Protocol

In the English Auction, the auctioneer seeks to find the market price of a good by initially proposing a price below that of the supposed market value, and then gradually raising the price. Each time the price is announced, the auctioneer waits to see if any buyers will signal their willingness to pay the proposed price. As soon as one buyer indicates that it will accept the price, the auctioneer issues a new call for bids with an incremented price. The auction continues until no buyers are prepared to pay the proposed price, at which point the auction ends. If the last price that was accepted by a buyer exceeds the auctioneer's (privately known) reservation price, the good is sold to that buyer for the agreed price. If the last accepted price is less than the reservation price, the good is not sold.

In the following protocol diagram, the auctioneer's calls, expressed as the general *cfp* act, are multicast to all participants in the auction. For simplicity, only one instance of the message is portrayed. Note also that in a physical auction, the presence of the auction participants in one room effectively means that each acceptance of a bid is simultaneously broadcast to all participants, not just the auctioneer. This may not be true in an agent marketplace, in which case it is possible for more than one agent to attempt to bid for the suggested price. Even though the auction will continue for as long as there is at least one bidder, the agents will need to know whether their bid (represented by the *propose* act) has been accepted. Hence the appearance in the protocol of *accept-proposal* and *reject-proposal* messages, despite this being implicit in the English Auction process that is being modelled.

Figure 888 — FIPA-auction-english protocol

7.3.8 FIPA-Auction-Dutch Protocol

In what is commonly called the *Dutch Auction*, the auctioneer attempts to find the market price for a good by starting bidding at a price much higher than the expected market value, then progressively reducing the price until one of the buyers accepts the price. The rate of reduction of the price is up to the auctioneer, and the auctioneer usually has a *reserve price* below which it will not go. If the auction reduces the price to the reserve price with no buyers, the auction terminates.

The term "Dutch Auction" derives from the flower markets in Holland, where this is the dominant means of determining the market value of quantities of (typically) cut flowers. In modelling the actual Dutch flower auction (and indeed in some other markets), some additional complexities occur. First, the good may be split: for example the auctioneer may be selling five boxes of tulips at price x , and a buyer may step in and purchase only three of the boxes. The auction then continues, with a price at the next increment below x , until

1209 the rest of the good is sold or the reserve price met. Such partial sales of goods are only present in some
1210 markets; in others the purchaser must bid to buy the entire good. Secondly, the flower market mechanism is
1211 set up to ensure that there is no contention amongst buyers, by preventing any other bids once a single bid has
1212 been made for a good. Offers and bids are binding, so there is no protocol for accepting or rejecting a bid. In
1213 the agent case, it is not possible to assume, and too restrictive to require, that such conditions apply. Thus it is
1214 quite possible that two or more bids are received by the auctioneer for the same good. The protocol below
1215 thus allows for a bid to be rejected. This is intended only to be used in the case of multiple, competing,
1216 simultaneous bids. It is outside the scope of this specification to pre-specify any particular mechanism for
1217 resolving this conflict. In the general case, the agents should make no assumptions beyond "first come, first
1218 served". In any given domain, other rules may apply.

1220 **Figure 999** — FIPA-auction-dutch protocol

1223 **Formal basis of ACL semantics**

1224 This section provides a formal definition of the communication language and its semantics. The intention
 1225 here is to provide a clear, unambiguous reference point for the standardised meaning of the inter-agent
 1226 communicative acts expressed through messages and protocols. This section of the specification is *normative*,
 1227 in that agents which claim to conform to the FIPA specification ACL must behave in accordance with the
 1228 definitions herein. However, this section may be treated as informative in the sense that no new information
 1229 is introduced here that is not already expressed elsewhere in this document. The non mathematically-inclined
 1230 reader may safely omit this section without sacrificing a full understanding of the specification.

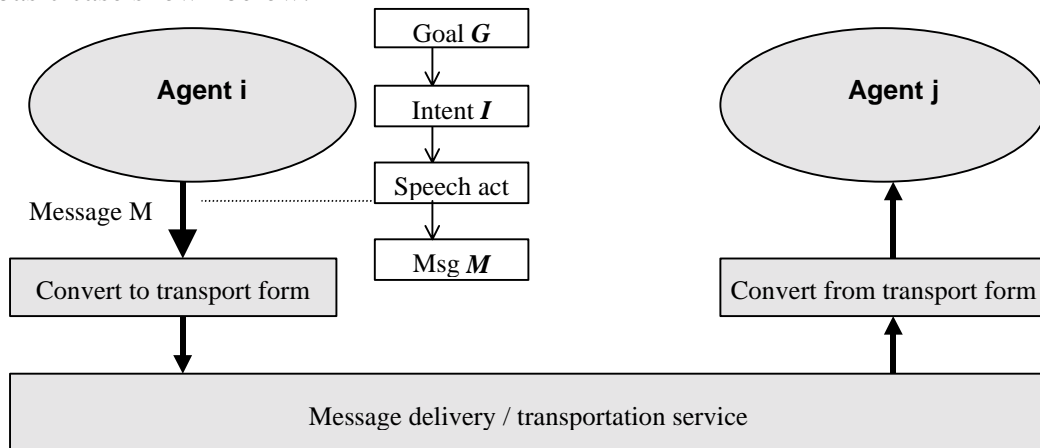

1231 Note also that *conformance testing*, that is, demonstrating in an unambiguous way that a given agent
 1232 implementation is correct with respect to this formal model, is not a problem which has been solved in this
 1233 FIPA specification. Conformance testing will be the subject of further work by FIPA.

1234 **8.1 Introduction to formal model**

1235 This section presents, in an informal way, the model of communicative acts that underlies the semantics of
 1236 the message language. This model is presented *only in order to ground the stated meanings* of
 1237 communicative acts and protocols. It is **not a proposed architecture** or a structural model of the agent
 1238 design.

1239 Other than the special case of agents that operate singly and interact only with human users or other software
 1240 interfaces, agents must communicate with each other to perform the tasks for which they are responsible.

1241 Consider the basic case shown below:

1242

1243 **Figure 101010 — Message passing between two agents**

1244 Suppose that, *in abstract terms*, Agent *i* has amongst its *mental attitudes* the following: some goal or
 1245 objective *G*, and some intention *I*. Deciding to satisfy *G*, the agent adopts a specific intention, *I*. Note that
 1246 neither of these statements entail a commitment on the design of *i*: *G* and *I* could equivalently be encoded as
 1247 explicit terms in the mental structures of a BDI agent, or implicitly in the call stack and programming
 1248 assumptions of a simple Java or database agent.

1249 Assuming that *i* cannot carry out the intention by itself, the question then becomes which message or set of
 1250 messages should be sent to another agent (*j* in the figure) to assist or cause intention *I* to be satisfied? If
 1251 agent *i* is behaving in some reasonable sense rationally, it will not send out a message whose effect will not
 1252 satisfy the intention and hence achieve the goal. For example, if Harry wishes to have a barbecue (*G* =
 1253 "have a barbecue"), and thus derives a goal to find out if the weather will be suitable (*G'* = "know
 1254 if it is raining today"), and thus intends to find out the weather (*I* = "find out if it
 1255 is raining"), he will be ill-advised to ask Sally "have you bought Acme stock today?". From Harry's
 1256 perspective, whatever Sally says, it will not help him to determine whether it is raining today.

Continuing the example, if Harry, acting more rationally, asks Sally "can you tell me if it is raining today?", he has acted in a way he hopes will satisfy his intention and meet his goal (assuming that Harry thinks that Sally will know the answer). Harry can reason that the effect of asking Sally is that Sally would tell him, hence making the request fulfil his intention. Now, having asked the question, can Harry actually assume that, sooner or later, he will know whether it is raining? Harry *can* assume that Sally knows that he does not know, *and* that she knows that he is asking her to tell him. But, simply on the basis of having asked, Harry cannot assume that Sally will act to tell him the weather: she is independent, and may, for example, be busy elsewhere.

In summary: an agent plans, explicitly or implicitly (through the construction of its software) to meet its goals ultimately by communicating with other agents, i.e. sending messages to them and receiving messages from them. The agent will select acts based on the relevance of the act's expected outcome or *rational effect* to its goals. However, *it cannot assume* that the rational effect will necessarily result from sending the messages.

8.2 The SL Language

SL, standing for *Semantic Language*, is the formal language used to define the semantics of the FIPA ACL. As such, SL itself has to be precisely defined. In this section, we present the SL language definition and the semantics of the primitive communicative acts.

8.2.1 Basis of the SL formalism

In SL, logical propositions are expressed in a logic of mental attitudes and actions, formalised in a first order modal language with identity⁶ (see [Sadek 91a] for details of this logic). The components of the formalism used in the following are as follows:

- p, p_1, \dots are taken to be closed formulas denoting propositions,
- \Box and \Diamond are formula schemas, which stand for any closed proposition
- i and j are schematic variables which denote agents
- \Box means that \Box is valid.

The mental model of an agent is based on the representation of three primitive attitudes: *belief*, *uncertainty* and *choice* (or, to some extent, *goal*). They are respectively formalised by the modal operators B , U , and C . Formulas using these operators can be read as:

- $B_i p$ " i (implicitly) believes (that) p "
- $U_i p$ " i is uncertain about p but thinks that p is more likely than $\neg p$ "
- $C_i p$ " i desires that p currently holds"

The logical model for the operator B is a *KD45* possible-worlds-semantics Kripke structure (see, e.g., [Halpern & Moses 85]) with the fixed domain principle (see, e.g., [Garson 84]).

To enable reasoning about action, the universe of discourse involves, in addition to individual objects and agents, sequences of events. A sequence may be formed with a single event. This event may be also the *void* event. The language involves terms (in particular a variable e) ranging over the set of event sequences.

To talk about complex *plans*, events (or actions) can be combined to form *action expressions*:

- $a_1 ; a_2$ is a *sequence* in which a_2 follows a_1
- $a_1 \ _ \ a_2$ is a *nondeterministic choice*, in which either a_1 happens or a_2 , but not both.

Action expressions will be noted a .

The operators *Feasible*, *Done* and *Agent* are introduced to enable reasoning about actions, as follows:

- $Feasible(a, p)$ means that a can take place and if it does p will be true just after that
- $Done(a, p)$ means that a has just taken place and p was true just before that

⁶ This logical framework is similar in many aspects to that of Cohen and Levesque (1990).

1299 $Agent(i, a)$ means that i denotes the only agent performing, or that will be performing, the actions
 1300 which appear in action expression a .

1301 $Single(a)$ means that a denotes an action expression that is not a sequence. Any individual action is
 1302 $Single$. The composite act $a ; b$ is not $Single$. The composite act $a \mid b$ is $Single$ iff both a and b
 1303 are $Single$.

1304 From belief, choice and events, the concept of *persistent goal* is defined. An agent i has p as a persistent goal,
 1305 if i has p as a goal and is self-committed toward this goal until i comes to believe that the goal is achieved or
 1306 to believe that it is unachievable. *Intention* is defined as a persistent goal imposing the agent to act. Formulas
 1307 as PG_p and I_p are intended to mean that “ i has p as a persistent goal” and “ i has the intention to bring about
 1308 p ”, respectively. The definition of I entails that *intention generates a planning process*. See [Sadek 92] for
 1309 the details of a formal definition of intention.

1310 Note that there is no restriction on the possibility of embedding mental attitude or action operators. For
 1311 example, formula $U_i B_j I_j Done(a, B_i p)$ informally means that agent i believes that, probably, agent j thinks
 1312 that i has the intention that action a be done before which i has to believe p .

1313 A fundamental property of the proposed logic is that the modelled agents are perfectly in agreement with their
 1314 own mental attitudes. Formally, the following schema is valid:

$$1315 \quad B_i$$

1316 where B_i is governed by a modal operator formalising a mental attitude of agent i .

1317 8.2.2 Abbreviations

1318 In the text below, the following abbreviations are used:

1319 i) $Feasible(a)$ $Feasible(a, True)$

1320 ii) $Done(a)$ $Done(a, True)$

1321 iii) $Possible(x)$ $(a)Feasible(a, x)$

1322 iv) Bif_i $B_i \quad B_i$

1323 Bif_i means that either agent i believes x or that it believes $\neg x$.

1324 v) $Bref_i(x)$ $(y)B_i(x) \quad (x) = y$

1325 where $Bref_i$ is the operator for definite description and $(x) \quad (x)$ is read “the (x which is) x ”. $Bref_i(x)$
 1326 means that agent i believes that it knows the (x which is) x .

1327 vi) Uif_i $U_i \quad U_i$

1328 Uif_i means that either agent i is uncertain (in the sense defined above) about x or that it is
 1329 uncertain about $\neg x$.

1330 vii) $Uref_i(x)$ $(y)U_i(x) \quad (x) = y$

1331 $Uref_i(x)$ has the same meaning as $Bref_i(x)$, except that agent i has an uncertainty attitude with
 1332 respect to (x) instead of a belief attitude

1333 viii) $AB_{n,i,j}$ $B_i B_j B_i \dots$

1334 introduces the concept of *alternate beliefs*, n is a positive integer representing the number of B
 1335 operators alternating between i and j .

1336 In the text, the term “knowledge” is used as an abbreviation for “believes or is uncertain of”.

1337 8.3 Underlying Semantic Model

1338 The components of a communicative act (CA) model that are involved in a planning process characterise
 1339 both the reasons for which the act is selected and the conditions that have to be satisfied for the act to be

1340 planned. For a given act, the former is referred to as the *rational effect* or RE^7 , and the latter as the *feasibility*
1341 *preconditions* or FP 's, which are the qualifications of the act.

1342 8.3.1 Property 1

1343 To give an agent the capability of planning an act whenever the agent intends to achieve its RE, the agent
1344 should adhere to the following property:

1345 Let a_k be an act such that:

1346 i) $(x) B_i a_k = x$,

1347 ii) p is the RE of a_k and

1348 iii) $C_i \text{ Possible}(\text{Done}(a_k))$;

1349 then the following formula is valid:

1350 $I_i p \quad I_i \text{Done}(a_1 \dots a_n)$

1351 where a_1, \dots, a_n are *all* the acts of type a_k .

1352 This property says that an agent's intention to achieve a given goal generates an intention that one of the acts
1353 known to the agent be done. Further, the act is such that its rational effect corresponds to the agent's goal, and
1354 that the agent has no reason for not doing it.

1355 The set of feasibility preconditions for a CA can be split into two subsets: the *ability preconditions* and the
1356 *context-relevance preconditions*. The ability preconditions characterise the intrinsic ability of an agent to
1357 perform a given CA. For instance, to *sincerely assert* some proposition p , an agent has to believe that p . The
1358 context-relevance preconditions characterise the relevance of the act to the context in which it is performed.
1359 For instance, an agent can be intrinsically able to make a promise while believing that the promised action is
1360 not needed by the addressee. The context-relevance preconditions correspond to the Gricean quantity and
1361 relation maxims.

1362 8.3.2 Property 2

1363 This property imposes on an agent an intention to seek the satisfiability of its FP 's, whenever the agent elects
1364 to perform an act by virtue of property 1⁸:

1365 $I_i \text{Done}(a) \quad B_i \text{Feasible}(a) \quad I_i B_i \text{Feasible}(a)$

1366 8.3.3 Property 3

1367 If an agent has the intention that (the illocutionary component of) a communicative act be performed, it
1368 necessarily has the intention to bring about the rational effect of the act. The following property formalises
1369 this idea:

1370 $I_i \text{Done}(a) \quad I_i RE(a)$

1371 where $RE(a)$ denotes the rational effect of act a .

1372 8.3.4 Property 4

1373 Consider now the complementary aspect of CA planning: the consuming of CA's. When an agent observes a
1374 CA, it should believe that the agent performing the act has the intention (to make public its intention) to
1375 achieve the rational effect of the act. This is called the *intentional effect*. The following property captures this
1376 intuition:

1377 $B_i(\text{Done}(a) \quad \text{Agent}(j, a) \quad I_j RE(a))$

1378 Note, for completeness only, that a strictly precise version of this property is as follows:

1379 $B_i(\text{Done}(a) \quad \text{Agent}(j, a) \quad I_j B_i I_j RE(a))$

⁷ Rational effect is also referred to as the *perlocutionary effect* in some of the work prior to this specification, e.g. [Sadek 90].

⁸ See [Sadek 91b] for a generalised version of this property.

8.3.5 Property 5

Some FP's persist after the corresponding act has been performed. For the particular case of CA's, the next property is valid for all the FP's which do not refer to time. In such cases, when an agent observes a given CA, it is entitled to believe that the persistent feasibility preconditions hold:

$$B_i(Done(a) \quad FP(a))$$

8.4 Notation

A communicative act model will be presented as follows:

$$\langle i, Act(j, C) \rangle$$

$$FP: \quad _1$$

$$RE: \quad _2$$

where *i* is the agent of the act, *j* the recipient, *Act* the name of the act, *C* stands for the semantic content or propositional content⁹, and $_1$ and $_2$ are propositions. This notational form is used for brevity, only within this section on the formal basis of ACL. The correspondence to the standard transport syntax adopted above is illustrated by a simple translation of the above example:

$$\begin{aligned} & (Act \\ & \quad :sender \ i \\ & \quad :receiver \ j \\ & \quad :content \ C) \end{aligned}$$

Note that this also illustrates that some aspects of the operational use of the FIPA-ACL fall outside the scope of this formal semantics but are still part of the specification. For example, the above example is actually incomplete without *:language* and *:ontology* parameters to given meaning to *C*, or some means of arranging for these to be known.

8.5 Primitive Communicative Acts

8.5.1 The assertive Inform

One of the most interesting assertives regarding the core of mental attitudes it encapsulates is the act of *informing*. An agent *i* is able to *inform* an agent *j* that some proposition *p* is true *only* if *i* believes *p* (i.e., only if *B_ip*). This act is considered to be context-relevant only if *i* does not think that *j* already believes *p* or its negation, or that *j* is uncertain about *p* (recall that belief and uncertainty are mutually exclusive). If *i* is already aware that *j* does already believe *p*, there is no need for further action by *i*. If *i* believes that *j* believes *not p*, *i* should *disconfirm p*. If *j* is uncertain about *p*, *i* should *confirm p*.

$$\langle i, INFORM(j, _) \rangle$$

$$FP: B_i \quad B_i(B_j _ \quad U_j _)$$

$$RE: B_j$$

The FP's for *inform* have been constructed to ensure mutual exclusiveness between CA's, when more than one CA might deliver the same rational effect.

Note, for completeness only, that the above version of the *Inform* model is the operationalised version. The complete theoretical version (regarding the FP's) is the following:

$$\langle i, INFORM(j, _) \rangle$$

$$FP: B_i \quad \bigwedge_{n>1} AB_{n,i,j} B_i \quad B_i B_j \quad \bigwedge_{n>2} AB_{n,i,j} B_j$$

$$RE: B_j$$

8.5.2 The directive Request

The following model defines the directive *Request*:

⁹ See [Searle 69] for the notions of *propositional content* (and *illocutionary force*) of an *illocutionary act*.

1422 $\langle i, REQUEST(j, a) \rangle$
 1423 FP: $FP(a) [i]j \quad B_i Agent(j, a) \quad B_i PG_j Done(a)$
 1424 RE: $Done(a)$

1425 where:

1426 a is a schematic variable for which any action expression can be substituted;
 1427 $FP(a)$ denotes the feasibility preconditions of a ;
 1428 $FP(a) [i]j$ denotes the part of the FP's of a which are mental attitudes of i .

1429 8.5.3 Confirming an uncertain proposition: Confirm

1430 The rational effect of the act *Confirm* is identical to that of most of the assertives, i.e., the addressee comes to
 1431 believe the semantic content of the act. An agent i is able to *confirm* a property p to an agent j *only* if i
 1432 believes p (i.e., $B_i p$). This is the sincerity condition an assertive act imposes on the agent performing the act.
 1433 The act *Confirm* is context-relevant *only* if i believes that j is uncertain about p (i.e., $B_i U_j p$). In addition, the
 1434 analysis to determine the qualifications required for an agent to be entitled to perform an *Inform* act remains
 1435 valid for the case of the act *Confirm*. These qualifications are identical to those of an *Inform* act for the part
 1436 concerning the ability preconditions, but they are different for the part concerning the context relevance
 1437 preconditions. Indeed, an act *Confirm* is irrelevant if the agent performing it believes that the addressee is not
 1438 uncertain of the proposition intended to be *confirmed*.

1439 In view of this analysis, the following is the model for the act *Confirm*:

1440 $\langle i, CONFIRM(j,) \rangle$
 1441 FP: $B_i \quad B_i U_j$
 1442 RE: B_j

1443 8.5.4 Contradicting knowledge: Disconfirm

1444 The *Confirm* act has a negative counterpart: the *Disconfirm* act. The characterisation of this act is similar to
 1445 that of the *Confirm* act and leads to the following model:

1446 $\langle i, DISCONFIRM(j,) \rangle$
 1447 FP: $B_i \quad B_i U_j \quad B_j$
 1448 RE: B_j

1449 8.6 Composite Communicative Acts

1450 An important distinction is made between acts that can be carried out directly, and those macro acts which
 1451 can be planned (which includes requesting another agent to perform the act), but cannot be directly carried
 1452 out. The distinction centres on whether it is possible to say that an act has been done, formally $Done(Action,$
 1453 $p)$ (see §08—

1454 [Formal basis of ACL semantics](#)~~8~~

Formal basis of ACL semantics). An act which is composed of primitive communicative actions (inform, request, confirm), or which is composed from primitive messages by substitution or sequencing (via the “;” operator), can be performed directly and can be said afterwards to be done. For example, agent i can inform j that p ; $Done(\langle i, inform(j, p) \rangle)$ is then true, and the meaning (i.e. the *rational effect*) of this action can be precisely stated.

However, a large class of other useful acts is defined by composition using the disjunction operator (written “|”). By the meaning of the operator, only one of the disjunctive components of the act will be performed when the act is carried out. A good example of these macro-acts is the *inform-ref* act. *Inform-ref* is a macro act defined formally by:

$$\langle i, INFORM-REF(j, x(x)) \rangle \quad \langle i, INFORM(j, x(x) = r_1) \rangle \mid \dots \mid \langle i, INFORM(j, x(x) = r_n) \rangle$$

where n may be infinite. This act may be requested (for example, j may request i to perform it), or i may plan to perform the act in order to achieve the (rational) effect of j knowing the referent of x . However, when the act is actually performed, what is sent, and what can be said to be *Done*, is an *inform* act.

Finally an inter-agent plan is a sequence of such communicative acts, using either composition operator, involving two or more agents. Communications protocols (q.v.) are primary examples of pre-enumerated inter-agent plans.

8.6.1 The closed-question case

In terms of illocutionary acts, exactly what an agent i is *requesting* when uttering a sentence such as “Is p ?” toward a recipient j , is that j performs the act of “*informing i that p*” or that j performs the act “*informing i that p*”. We know the model for both of these acts: $\langle j, INFORM(i, p) \rangle$. In addition, we know the relation “or” set between these two acts: it is the relation that allows for the building of action expressions which represent a *non-deterministic choice* between several (sequences of) events or actions.

In fact, as mentioned above, the semantic content of a directive refers to an *action expression*; so, this can be a *disjunction* between two or more acts. Hence, by using the utterance “Is p ?”, what an agent i *requests* an agent j to do is the following action expression:

$$\langle j, INFORM(i, p) \rangle \quad \langle j, INFORM(i, p) \rangle$$

It seems clear that the semantic content of a directive realised by a yes/no-question can be viewed as an action expression characterising an indefinite choice between two CA’s *Inform*. In fact, it can also be shown that the binary character of this relation is only a special case: in general, any number of CA’s *Inform* can be handled.

In this case, the addressee of a directive is allowed to choose one among several acts. This is not only a theoretical generalisation: it accounts for classical linguistic behaviour traditionally called *Alternatives question*. An example of an utterance realising an alternative question is “Would you like to travel in first class, in business class, or in economy class?”. In this case, the semantic content of the *request* realised by this utterance is the following action expression:

$$\langle j, INFORM(i, p_1) \rangle \quad \langle j, INFORM(i, p_2) \rangle \quad \langle j, INFORM(i, p_3) \rangle$$

where p_1, p_2 and p_3 are intended to mean respectively that j wants to travel in first class, in business class, or in economy class.

As it stands, the agent designer has to provide the plan-oriented model for this type of action expression. In fact, it would be interesting to have a model which is not specific to the action expressions characterising the non-deterministic choice between CA’s of type *Inform*, but a more general model where the actions referred to in the disjunctive relation remain unspecified. In other words, to describe the preconditions and effects of the expression $a_1 \ a_2 \ \dots \ a_n$ where a_1, a_2, \dots, a_n are any action expressions. It is worth mentioning that the goal is to characterise this action expression as a *disjunctive macro-act* which is planned as such; we are not attempting to characterise the non-deterministic choice between acts which are planned separately. In both cases, the result is a branching plan but in the first case, the plan is branching in an *a priori* way while in the second case it is branching in an *a posteriori* way.

1501 An agent will plan a macro-act of non-deterministic choice when it intends to achieve the rational effect of
 1502 one of the acts composing the choice, *no matter which one it is*. To do that, one of the feasibility
 1503 preconditions of the acts must be satisfied, *no matter which one it is*. This produces the following model for a
 1504 disjunctive macro-act:

1505 $a_1 \ a_2 \ \dots \ a_n$

1506 FP: $FP(a_1) \ FP(a_2) \ \dots \ FP(a_n)$

1507 RE: $RE(a_1) \ RE(a_2) \ \dots \ RE(a_n)$

1508 where $FP(a_k)$ and $RE(a_k)$ represent the FP's and the RE of the action expression a_k , respectively.

1509 Because the yes/no-question, as shown, is a particular case of alternatives question, the above model can be
 1510 specialised to the case of two acts *Inform* having opposite semantic contents. Thus, we get the following
 1511 model:

1512 $\langle i, \text{INFORM}(j, \) \rangle \ \langle i, \text{INFORM}(j, \) \rangle$

1513 FP: $Bif_i \ B_i(Bif_j \ Uif_j \)$

1514 RE: Bif_j

1515 In the same way, we can derive the disjunctive macro-act model which gathers the acts *Confirm* and
 1516 *Disconfirm*. We will use the abbreviation $\langle i, \text{CONFDISCONF}(j, \) \rangle$ to refer to the following model:

1517 $\langle i, \text{CONFIRM}(j, \) \rangle \ \langle i, \text{DISCONFIRM}(j, \) \rangle$

1518 FP: $Bif_i \ B_i U_j$

1519 RE: Bif_j

1520 8.6.2 The query-if act:

1521 Starting from the act models $\langle j, \text{INFORM-IF}(i, \) \rangle$ and $\langle i, \text{REQUEST}(j, a) \rangle$, it is possible to derive the
 1522 query-if act model (and not plan, as shown below). Unlike a confirm/disconfirm-question, which will be
 1523 addressed below, a query-if act requires the agent performing it not to have any knowledge about the
 1524 proposition whose truth value is asked for. To get this model, a transformation¹⁰ has to be applied to the FP's
 1525 of the act $\langle j, \text{INFORM-IF}(i, \) \rangle$ and leads to the following model for a query-if act:

1526 $\langle i, \text{QUERY-IF}(j, \ \langle i, \text{REQUEST}(j, \langle j, \text{INFORM-IF}(i, \) \rangle) \rangle) \rangle$

1527 FP: $Bif_i \ Uif_i \ B_i \ PG_j \text{Done}(\langle j, \text{INFORM-IF}(i, \) \rangle)$

1528 RE: $\text{Done}(\langle j, \text{INFORM}(i, \) \rangle \ \langle j, \text{INFORM}(i, \) \rangle)$

1529 8.6.3 The confirm/disconfirm-question act:

1530 In the same way, it is possible to derive the following *Confirm/Disconfirm-question* act model:

1531 $\langle i, \text{REQUEST}(j, \langle j, \text{CONFDISCONF}(i, \) \rangle) \rangle$

1532 FP: $U_i \ B_i \ PG_j \text{Done}(\langle j, \text{CONFDISCONF}(i, \) \rangle)$

1533 RE: $\text{Done}(\langle j, \text{CONFIRM}(i, \) \rangle \ \langle j, \text{DISCONFIRM}(i, \) \rangle)$

1534 8.6.4 The open-question case:

1535 *Open question* is a question which does not suggest a choice and, in particular, which does not require a
 1536 yes/no answer. A particular case of open questions are the questions which require referring expressions as an
 1537 answer. They are generally called *wh-questions*. The “wh” refers to interrogative pronouns such as “what”,
 1538 “who”, “where”, or “when”. Nevertheless, this must not be taken literally since the utterance “How did you
 1539 travel?” can be considered as a wh-question.

1540 A formal plan-oriented model for the wh-questions is required. In the model below, *from the addressee's*
 1541 *viewpoint*, this type of question can be viewed as a closed question where the suggested choice is not made

¹⁰ For more details about this transformation, called the *double-mirror transformation*, see [Sadek 91a, 91b].

1542 explicit because it is *too wide*. Indeed, a question such as “What is your destination?” can be restated as
 1543 “What is your destination: Paris, Rome,... ?”.

1544 The problem is that, in general, the set of definite descriptions among which the addressee can (and must)
 1545 choose is potentially an infinite set, not because, referring to the example above, there may be an infinite
 1546 number of destinations, but because, theoretically, each destination can be referred to in potentially an infinite
 1547 number of ways. For instance, Paris can be referred to as “the capital of France”, “the city where the Eiffel
 1548 Tower is located”, “the capital of the country where the Man-Rights Chart was founded”, *etc.* However, it
 1549 must be noted that in the context of man-machine communication, the language used is finite and hence the
 1550 number of descriptions acceptable as an answer to a *wh-question* is also finite.

1551 When asking a *wh-question*, an agent *j* intends to acquire from the addressee *i* an identifying referring
 1552 expression (IRE) [Sadek 90] for a definite description, in the general case. Therefore, agent *j* intends to make
 1553 his interlocutor *i* perform a CA which is of the following form:

$$1554 \quad \langle i, \text{INFORM}(j, x(x) = r) \rangle$$

1555 where *r* is an IRE (*e.g.*, a standard name or a definite description) and $x(x)$ is a definite description. Thus,
 1556 the semantic content of the directive performed by a *wh-question* is a disjunctive macro-act composed with
 1557 acts of the form of the act above. Here is the model of such a macro-act:

$$1558 \quad \langle i, \text{INFORM}(j, x(x) = r_1) \rangle \dots \langle i, \text{INFORM}(j, x(x) = r_k) \rangle$$

1559 where r_k are IREs. To deal with the case of closed questions, the generic plan-oriented model proposed for a
 1560 disjunctive macro-act can be instantiated for the account of the macro-act above. Note that the following
 1561 equivalence is valid:

$$1562 \quad (B_i x(x) = r_1 \ B_i x(x) = r_2 \ \dots) \quad (y) B_i x(x) = y$$

1563 This produces the following model, which is referred to as $\langle i, \text{INFORM-REF}(j, x(x)) \rangle$:

$$1564 \quad \langle j, \text{INFORM-REF}(i, x(x)) \rangle$$

$$1565 \quad \text{FP: } \text{Bref}_i(x(x)) \quad \text{Uref}_i(x(x)) \quad \text{B}_j \text{I}_i \text{Done}(\langle j, \text{Inform-ref}(i, x(x)) \rangle)$$

$$1566 \quad \text{RE: } \text{Done}(\langle j, \text{Inform}(i, x(x) = r_1) \rangle) \dots \langle j, \text{Inform}(i, x(x) = r_k) \rangle$$

1567 where $\text{Bref}_j(x)$ and $\text{Uref}_j(x)$ are abbreviations introduced above, and $\text{ref}_j(x)$ is an abbreviation defined as:

$$1568 \quad \text{ref}_j(x) \quad \text{Bref}_j(x) \quad \text{Uref}_j(x)$$

1569 Provided the act models $\langle j, \text{INFORM-REF}(i, x(x)) \rangle$ and $\langle i, \text{REQUEST}(j, a) \rangle$, the *wh-question* act model
 1570 can be built up in the same way as for the *yn-question* act model. Applying the same transformation to the
 1571 FP’s of the act schema $\langle j, \text{INFORM-REF}(i, x(x)) \rangle$, and by virtue of property 3, the following model is
 1572 derived:

$$1573 \quad \langle i, \text{REQUEST}(j, \langle j, \text{INFORM-REF}(i, x(x)) \rangle) \rangle$$

$$1574 \quad \text{FP: } \text{ref}_i(x) \quad \text{B}_i \text{PG}_j \text{Done}(\langle j, \text{INFORM-REF}(i, x(x)) \rangle)$$

$$1575 \quad \text{RE: } \text{Done}(\langle i, \text{INFORM}(j, x(x) = r_1) \rangle) \dots \langle i, \text{INFORM}(j, x(x) = r_k) \rangle$$

1576 8.6.5 Summary definitions for all standard communicative acts

1577 1.1.1.1 Note on use of symbols in formulae

1578 Note that variable symbols are used in the following definitions as shown below:

1579 **Table 333 — Meaning of symbols in formulae**

Symbol:	Usage:
<i>a</i>	Used to denote an action E.g. $a = \langle i, \text{inform}(j, p) \rangle$
<i>act</i>	Used to denote an action type. E.g. $\text{act} = \text{inform}(j, p)$

	Thus, if $a = \langle i, \text{inform}(j, p) \rangle$ and $act = \text{inform}(j, p)$ then $a = \langle i, act \rangle$
	Used to denote any closed proposition (without any restriction).
p	Used to denote a given proposition.
	Thus ' ' is a formula schema, i.e., a variable that denotes a formula, and 'p' is a formula (not a variable).

1581 Consider the following axiom examples:

1582 $I_i \quad B_i$,

1583 Here, stands for any formula. It is a variable.

1584 $B_i(\text{Feasible}(a) \quad p)$

1585 Here, p stands for a given formula: the FP of act 'a'.

1586

1587 **8.6.5.2 Supporting definitions**

1588 $\text{Enables}(e, \quad) = \text{Done}(e, \quad)$

1589 $\text{Has-never-held-since}(e', \quad) = (\quad e1) (\quad e2) \text{Done}(e'; e1 ; e2) \quad \text{Done}(e2, \quad)$

1590

1591 **8.6.5.3 Accept-proposal**

1592 $\langle i, \text{accept-proposal}(j, \langle j, act \rangle, \quad) \rangle$

1593 $\langle i, \text{inform}(j, I_i \text{Done}(\langle j, act \rangle, \quad)) \rangle$

1594 FP : $B_i \quad B_i (Bif_j \quad Uif_j \quad)$

1595 RE : B_j

1596 where

1597 $= I_i \text{Done}(\langle j, act \rangle, \quad)$

1598 i informs j that i has the intention that j will perform action a just as soon as the precondition becomes true.

1599 **8.6.5.4 Agree**

1600 $\langle i, \text{agree}(j, \langle i, act \rangle, \quad) \rangle$

1601 $\langle i, \text{inform}(j, I_i \text{Done}(\langle i, act \rangle, \quad)) \rangle$

1602 FP : $B_i \quad B_i (Bif_j \quad Uif_j \quad)$

1603 RE : B_j

1604 where

1605 $= I_i \text{Done}(\langle i, act \rangle, \quad)$

1606 Note that the formal difference between the semantics of agree and accept-proposal rests on which agent is performing the action.

1608 **8.6.5.5 Cancel**

1609 $\langle i, \text{cancel}(j, a) \rangle$

1610 $\langle i, \text{disconfirm}(j, I_i \text{Done}(a)) \rangle$

1611 FP : $I_i \text{ Done}(a) \quad B_i (B_j I_i \text{ Done}(a) \quad U_j I_i \text{ Done}(a))$

1612 RE : $B_j \quad I_i \text{ Done}(a)$

1613 *Cancel* is the action of cancelling any form of *requested* action. In other words, an agent *i* has requested an
 1614 agent *j* to perform some action, possibly if some condition holds. This has the effect of *i* informing *j* that *i* has
 1615 an intention. When *i* comes to drop its intention, it has to inform *j* that it no longer has this intention, i.e. a
 1616 *disconfirm*.

1617 There is no constraint on the agent who do action '*a*' (it can be '*i*', '*j*' or any other agent).

1618 8.6.5.6 CFP

1619 $\langle i, \text{cfp}(j, \langle j, \text{act} \rangle, (x)) \rangle$

1620 $\langle i, \text{query-ref}(j, x (I_i \text{ Done}(\langle j, \text{act} \rangle, (x)) (I_j \text{ Done}(\langle j, \text{act} \rangle, (x)))) \rangle$

1621 FP : $\text{Bref}_i(x (x)) \quad \text{Uref}_i(x (x)) \quad B_i I_j \text{ Done}(\langle j, \text{Inform-ref}(i, x (x)) \rangle)$

1622 RE : $\text{Done}(\langle j, \text{Inform}(i, x (x) = r_l) \rangle | \dots | \langle j, \text{Inform}(i, x (x) = r_k) \rangle)$

1623 where

1624 $(x) = I_j \text{ Done}(\langle j, \text{act} \rangle, (x)) \quad I_j \text{ Done}(\langle j, \text{act} \rangle, (x))$

1625 Agent *i* asks agent *j*: "What is the '*x*' such that you will perform action '*a*' when '*p(x)*' holds?"

1626 8.6.5.7 Confirm

1627 $\langle i, \text{confirm}(j,) \rangle$

1628 FP: $B_i \quad B_i U_j$

1629 RE: B_j

1630 Confirm is a primitive communicative act.

1631 8.6.5.8 Disconfirm

1632 $\langle i, \text{disconfirm}(j,) \rangle$

1633 FP: $B_i \quad B_i (U_j \quad B_j)$

1634 RE: B_j

1635 Disconfirm is a primitive communicative act.

1636 8.6.5.9 Failure

1637 $\langle i, \text{failure}(j, a,) \rangle$

1638 $\langle i, \text{inform}(j, (e) \text{ Single}(e) \quad \text{Done}(e, \text{Feasible}(a) \quad I_i \text{ Done}(a))$

1639 $\text{Done}(a) \quad I_i \text{ Done}(a)) \rangle$

1640 FP : $B_i \quad B_i (Bif_j \quad Uif_j)$

1641 RE : B_j

1642 where

1643 $= (e) \text{ Single}(e) \quad \text{Done}(e, \text{Feasible}(a) \quad I_i \text{ Done}(a)) \quad \text{Done}(a) \quad I_i \text{ Done}(a)$

1644 *i* informs *j* that, in the past, *i* had the intention to do action *a* and *a* was feasible. *i* performed the action of
 1645 attempting to do *a* (i.e. the action/event *e* is the attempt to do *a*), but now *a* has not been done and *i* no longer
 1646 has the intention to do *a*, and some formula is true.

1647 The informal implication is that is the reason that the action failed, though this causality is not expressed
 1648 formally in the semantic model.

1649 8.6.5.10 Inform

1650 $\langle i, \text{inform}(j,) \rangle$

1651 FP: $B_i \quad B_i (Bif_j \quad Uif_j)$

1652 RE: B_j

1653 Inform is a primitive communicative act.

1654 **8.6.5.11 Inform-if**1655 $i, \text{inform-if}(j, \)>$ 1656 $\langle i, \text{inform}(j, \) \rangle | \langle i, \text{inform}(j, \) \rangle$ 1657 FP : $Bif_i \quad B_i(Bif_j \quad Uif_j \)$ 1658 RE : Bif_j

1659 Inform-if represents two possible courses of action: i informs j that p, or i informs j that not p.

1660 **8.6.5.12 Inform-ref**1661 $\langle i, \text{inform-ref}(j, x \ (x)) \rangle$ 1662 $\langle i, \text{Inform}(j, x \ (x) = r_1) \rangle \dots \langle i, \text{Inform}(j, x \ (x) = r_k) \rangle$ 1663 FP: $Bref_i \ x \ (x) \quad B_i(Bref_j \ x \ (x) \quad Uref_j \ x \ (x))$ 1664 RE: $Bref_j \ x \ (x)$

1665 Inform-ref represents an unbounded, possibly infinite set of possible courses of action, in which i informs j of the referent of x.

1666 **8.6.5.13 Not-understood**1667 $\langle i, \text{not-understood}(j, a) \rangle$ 1669 $\langle i, \text{Inform}(j, (\ x) B_i((e \text{ Done}(e) \quad \text{Agent}(e, j) \quad B_j(\text{Done}(e) \quad \text{Agent}(e, j) \quad (a = e))) = x)) \rangle$

1670

1671 FP : $B_i \quad B_i(Bif_j \quad Uif_j \)$ 1672 RE : B_j

1673 where

1674 $= (\ x) B_i((e \text{ Done}(e) \quad \text{Agent}(e, j) \quad B_j(\text{Done}(e) \quad \text{Agent}(e, j) \quad (a = e))) = x)$

1675 Agent 'i' doesn't know the last event it has observed:

1676 $(\ x) B_i((e \text{ Done}(e) \quad \text{Agent}(e, j)) = x)$

1677 Agent 'i' believes that agent 'j' knows 'a' to be the last event it ('j') just performed:

1678 $B_i((e) B_j(\text{Done}(e) \quad \text{Agent}(e, j) \quad (a = e))$

1679 Note that the existential expression is captured by the iota expression.

1680 **8.6.5.14 Propose**1681 $\langle i, \text{propose}(j, \langle i, \text{act} \rangle, \) \rangle$ 1682 $\langle i, \text{inform}(j, I_j \text{ Done}(\langle i, \text{act} \rangle, \) \quad I_i \text{ Done}(\langle i, \text{act} \rangle, \)) \rangle$ 1683 FP : $B_i \quad B_i(Bif_j \quad Uif_j \)$ 1684 RE : B_j

1685 where

1686 $= I_j \text{ Done}(\langle i, \text{act} \rangle, \) \quad I_i \text{ Done}(\langle i, \text{act} \rangle, \)$

1687 i informs j that, once j informs i that j has adopted the intention for i to perform action a, and the preconditions for i performing a have been established, i will adopt the intention to perform a.

1688 **8.6.5.15 Query-if**1689 $\langle i, \text{query-if}(j, \) \rangle$ 1690 $\langle i, \text{request}(j, \langle j, \text{inform-if}(i, \) \rangle) \rangle$ 1691 FP: $Bif_j \quad Uif_j \quad B_j I_j \text{ Done}(\langle j, \text{inform-if}(i, \) \rangle)$ 1692 RE: $\text{Done}(\langle j, \text{inform}(i, \) \rangle | \langle j, \text{inform}(i, \) \rangle)$

1693 i requests j that j informs i whether or not is true.

1694 **8.6.5.16 Query-ref**1695 $\langle i, \text{query-ref}(j, x \ (x)) \rangle$ 1696 $\langle i, \text{request}(j, \langle j, \text{inform-ref}(i, x \ (x)) \rangle) \rangle$

1698 FP: $Bref(x(x)) \quad Uref(x(x)) \quad B_i I_j Done(<j, inform-ref(i, x(x))>)$

1699 RE: $Done(<j, Inform(i, x(x) = r_l)> \dots <j, Inform(i, x(x) = r_k)>)$

1700 i requests j that j informs i of the referent of x

1701 8.6.5.17 Refuse

1702 $<i, refuse(j, <i, act>,)>$

1703 $<i, disconfirm(j, Feasible(<i, act>))>;$

1704 $<i, inform(j, Done(<i, act>) \quad I_i Done(<i, act>))>$

1705 FP : $B_i Feasible(<i, act>) \quad B_i (B_j Feasible(<i, act>) \quad U_j Feasible(<i, act>))$

1706 $B_i \quad B_i (Bif_j \quad Uif_j)$

1707 RE : $B_j Feasible(<i, act>) \quad B_j$

1708 where

1709 $= Done(<i, act>) \quad I_i Done(<i, act>)$

1710 i informs j that action a is not feasible, and further that, because of proposition , a has not been done and i

1711 has no intention to do a.

1712 8.6.5.18 Reject-proposal

1713 $<i, reject-proposal(j, <j, act>, ,)>$

1714 $<i, inform(j, I_i Done(<j, act>,))>$

1715 FP : $B_i \quad B_i (Bif_j \quad Uif_j)$

1716 RE : B_j

1717 where

1718 $= I_i Done(<j, act>,)$

1719 i informs j that, because of proposition , i does not have the intention for j to perform action a with

1720 precondition .

1721 8.6.5.19 Request

1722 $<i, request(j, a)>$

 1752

1753 **8.7 Inter-agent Communication Plans**

1754 The properties of rational behaviour stated above in the definitions of the concepts of rational effect and of
 1755 feasibility preconditions for CA'S suggest an algorithm for CA planning. A plan is built up by this algorithm
 1756 builds up through the inference of causal chain of intentions, resulting from the application of properties 1
 1757 and 2.

1758 With this method, it can be shown that what are usually called “*dialogue acts*” and for which models are
 1759 postulated, are, in fact, complex plans of interaction. These plans can be derived from primitive acts, by using
 1760 the principles of rational behaviour. The following is an example of how such plans are derived.

1761 The interaction plan “hidden” behind a question act can be more or less complex depending on the agent
 1762 mental state when the plan is generated.

1763 Let a *direct question* be a question underlain by a plan which is limited to the reaction strictly legitimised by
 1764 the question. Suppose that the main content of i 's mental state is:

1765 $B_i Bif_j ,$
 1766 $I_i Bif_i$

1767 By virtue of property 1, the intention is generated that the act $\langle j, \text{INFORM-IF}(i,) \rangle$ be performed. Then,
 1768 according to property 2, there follows the intention to bring about the feasibility of this act. Then, the problem
 1769 is to know whether the following belief can be derived at that time from i 's mental state:

1770 $B_i (Bif_j (B_j Bif_i \quad Uif_i$

1771 This is the case with i 's mental state. By virtue of properties 1 and 2, the intention that the act
 1772 $\langle i, \text{REQUEST}(j, \langle j, \text{INFORM-IF}(i,) \rangle) \rangle$ be done and then the intention to achieve its feasibility, are
 1773 inferred. The following belief is derivable:

1774 $B_i (Bif_i \quad Uif_i$

1775 Now, no intention can be inferred. This terminates the planning process. The performance of a direct strict-
 1776 yn-question plan can be started by uttering a sentence such as “Has the flight from Paris arrived?”, for
 1777 example.

1778 Given the FP's and the RE of the plan above, the following model for a *direct strict-yn-question plan* can be
 1779 established:

1780 $\langle i, \text{YNQUESTION}(j,) \rangle$
 1781 FP: $B_i Bif_j \quad Bif_i \quad Uif_i \quad B_i \quad B_j (Bif_i \quad Uif_i)$
 1782 RE: Bif_i

 (informative)

ACL Conventions and Examples

This annex describes certain conventions that, while not a mandatory part of the specification, are commonly adopted practices that aid effective inter-agent communications. This annex will also serve to provide examples of ACL usage for illustrative purposes.

A.1.1 Conventions

A.1.1.1 Conversations amongst multiple parties in agent communities

There is commonly a need in inter-agent dialogues to involve more than two parties in the conversation. A typical example would be of agent *i* posing a question to agent *j* by sending a *query-if* message. Agent *i* believes that *j* is able to answer the query, but in fact *j* finds it necessary to delegate some or all of the task of answering the question to another agent *k*.

The formal definition of the query-if communicative act reads that *i* is requesting *j* that *j informs i* of the truth of proposition *p*. Therefore, even if *j* does delegate all of the query to *k*, the semantics of ACL requires that *j* will be the one to perform the act of informing *i*. *K* cannot inform *i* directly. By extension, any chain of such delegation acts will have to be unwound in reverse order to conform to the current specification.

The restriction that a delegating agent in such a scenario must, in effect, remain "in the loop" clearly does not alter the meaning of the act (except, perhaps, that it exposes *i* to the existence of *k*), but it can be critiqued on the grounds of overall efficiency. A future version of this specification may generalise the semantic definition to allow delegation which includes passing responsibility for answering the originator of the request directly.

See also §A.1.4A.1.4A.1.4A.1.4 *Negotiating by exchange of goals*.

A.1.2 Maintaining threads of conversation

Agents are frequently implemented with the ability to participate in more than one conversation at the same time. These conversations may all be with different agents, or may be with the same agent but in the context of different tasks or subjects. The internal representation and maintenance of structures to manage the separate conversations is a matter for the agent designer. However, there must be some support in the ACL for the concept of separate conversations, else an agent will have no standardised way of disambiguating the conversational context in which to interpret a given message. ACL supports conversation threading through the use of standard message parameters which agents are free (but not required) to use. These are: *:reply-with*, *:in-reply-to* and *:conversation*. Additional contextual information to assist the agent to interpret the meaning of a message is provided through the protocol identifier, *:protocol*.

The first case is one of annotating a message which is expected to generate a response with an expression which serves to abbreviate the context of the enquiry. This abbreviation is then cross-referenced in the reply. For example, agent *i* asks agent *j* if the summer in England was wet. Without any ability to refer back to the question, *j* cannot simply say "yes" because that would be potentially ambiguous. *J* can disambiguate its reply by saying "yes, the summer in England was wet", or it could say "in response to your question, the answer is yes". Different styles and implementations of agents might adopt either of these tactics. The latter case is performed through the use of *:reply-with* and *:in-reply-to*. The *:reply-with* parameter is used to introduce an abbreviation for the query, *:in-reply-to* is used to refer back to it. For example:

```

1876     (ask-if
1877         :sender I
1878         :receiver j
1879         :content (= (weather England (summer 1997)) wet)
1880         :ontology meteorology
1881         :reply-with query-17)
1882
1883     (inform
1884         :sender j
1885         :receiver I
1886         :content true
1887         :in-reply-to query-17)

```

1888 In addition to maintaining context over instances of exchanges of communicative acts, the agents may also
 1889 wish to maintain a longer lived conversational structure. They may be exchanging information about the
 1890 weather in the UK, and at the same time be discussing that of Peru. The conversation can provide additional
 1891 interpretative context: for example the question "what was the weather like in the summer?" is meaningful in
 1892 the context of a conversation about UK meteorology, and rather less so if no such context is known. In
 1893 addition, the conversation may simply be used by the agent to manage its communication activities,
 1894 particularly if conversations are strongly link to current tasks. The parameter *:conversation-id* is used to
 1895 denote a word which identifies the conversation.

1896 [A.1.3A.1.3](#) **Initiating sub-conversations within protocols**

1897 The use of protocols (c.f. §[Interaction Protocols](#)~~Interaction Protocols~~) in agent interactions is introduced in
 1898 order to provide a tool that facilitates the simplification of the design of some agents, since the agent can
 1899 expect to know which messages are likely to be received or need to be generated at each stage of the
 1900 conversation. However, this simplicity can also be restrictive: there may legitimately be cause to step outside
 1901 the prescribed bounds of the protocol. For example, in a contract net protocol, the manager sends out a *cfp*
 1902 message, which should normally be followed by a *propose* or a refusal. Suppose that the contractor, however,
 1903 wishes some additional information (perhaps a clarification). Replying to the *cfp* with, for example, a *query-if*
 1904 action would break the protocol. While agents with powerful, complete reasoning capabilities can be
 1905 expected to deal appropriately with such an occurrence, simpler agents, adhering closely to the protocol, may
 1906 not. Nor is it a solution to anticipate all such likely responses in the protocol: such anticipation is unlikely to
 1907 cover every possibility, and anyway the resulting complexity would defeat the primary purpose of the
 1908 protocol.

1909 Instead, the convention is suggested that adopting a new conversation-id (see above) for a reply is sufficient
 1910 to indicate to the receiver that the reply should not be considered the next step in the protocol. It should not
 1911 cause a not-understood message to be generated (the normal occurrence if a protocol is broken unexpectedly).
 1912 A problem remains that adopting a new conversation-id does not make available to the agents involved the
 1913 convenience of knowing that a rich context is shared. This release of the specification does not address the
 1914 issue of structured conversation-id's, in which the idea of a context-sharing sub-conversation is supported,
 1915 though a future version may do so. In the interim, it is suggested that, where a given domain finds that this
 1916 capability is a necessity, a domain specific solution to the problem of defining conversation-id's is adopted.

1917 [A.1.4A.1.4](#) **Negotiating by exchange of goals**

1918 A common practice amongst agent communities is to interact and negotiate at the level of goals and
 1919 commitments, rather than explicit commands. Indeed, some researchers will say that such *indirect*
 1920 *manipulation* is one of the most compelling arguments for the effectiveness of the agent technology
 1921 paradigm.

While the ACL semantics does include a concept of goal and intention, the core communicative act for influencing another agent's behaviour is the *request* action. The main argument to request is an action, not a goal, which requires the requesting agent to be aware of the actions that another agent can perform, and to plan accordingly. In many instances, the agent may wish to communicate its objectives, and leave the reasoning and planning towards the achievement of those objectives to the recipient agent. Since no *achieve-goal* action is currently built-in to the ACL, it is common to embed the goal in an expression in the chosen content language which expresses the *action of achieving the goal*. This action can then be requested by the sending agent. Precise details of such a goal encoding depend on the chosen content language. An example might be:

```
(request
  :sender i
  :receiver j
  :content (achieve (at (location 12 84) box17))
  :ontology factory-management
  :reply-with query-17)
```

Note, for symmetry, that a converse domain action *achieved* can also be used to map actions to goals.

[A.2A.2A.2](#) Additional examples

[A.2.1A.2.1A.2.1](#) Actions and results

In general, the semantic model underlying the ACL states that an action does not have a value. Clearly all actions have effects, which are causally related to the performance of the action. However, it may be difficult or impossible to determine the causal effects of an action. Even *a posteriori* observation may not be able to determine all of the effects of an action. Thus, in general, actions do not have a result. SL allows the capture of some intuitive notions about the effects of actions by associating the occurrence of the action with statements about the state of the world through the *Done* and *Feasible* operators. However, there is a class of actions which are defined as computational activities, in which it is useful to say that the action has a result. For example, the action of adding two and two in a computational device. These actions are related to the result they produce through the result predicate, which is the remit of a content language and given domain theory. In defining the result predicate, it should be noted that it takes as an argument a term, not an action which is a separate category.

Consider the following three example actions:

```
A: (request      :sender i   :receiver j
      :content (action j action))

B: (query-ref   :sender i   :receiver j
      :content (iota ?x (result (action-term j action) ?x)))

C: (request      :sender i   :receiver j
      :content (action j action))      ;
      (inform-ref  :sender j   :receiver i
      :content (iota ?x (result (action-term j action) ?x)))
```

The question then arises as to the differences between these actions. In summary, the meaning of the actions, are, respectively:

A: Agent i says to j "do *action*", but does not say anything about the result

B: Agent i says to j "tell me the result of doing *action*"

C: Agent i says to j "do *action*, and then inform me of the result of doing *action*".

1968 In action B, the question can legitimately be asked whether the action is actually performed or not. It should
1969 be noted that *result* is a function in the domain language, SL in this case. Thus this question must really be
1970 devolved to the domain representation language. Some languages may be able to compute the meaning of an
1971 action without performing that action: this would be very useful for planning agents who may not wish to
1972 perform an action before considering its likely effects¹¹. Other agents, such as expression simplifiers, do not
1973 want to be overburdened with the complexity of performing the simplification, then separately having to
1974 inform the questioner of the result of the simplification. Of course, if the meaning of the result predicate in a
1975 given context is that the action does, in fact, get done, then example C will likely result in the action being
1976 done twice.
1977

¹¹ Consider the bomb disposal agent being asked "what is [i.e. would be] the effect of cutting the red wire?". Agents which are able to reason about the future consequences of their actions are likely to differentiate between the operation of observing the effects of an action (*result* predicate) and predicting the effects (an *effect-of* predicate perhaps).

~~Annex B~~
Annex B
 (informative)

SL as a Content Language

This annex introduces a concrete syntax for the SL language that is compatible with the description in ~~§0~~~~Formal basis of ACL semantics~~~~Formal basis of ACL semantics~~. This syntax, and its associated semantics, are suggested as a candidate *content language* for use in conjunction with FIPA ACL. In particular, the syntax is defined to be a sub-grammar of the very general s-expression syntax specified for message content in ~~§6.4~~~~Message syntax~~~~6.4~~~~Message syntax~~.

This content language is included in the specification on an *informative* basis. *It is not mandatory for any FIPA specification agent to implement the computational mechanisms necessary to process all of the constructs in this language.* However, SL is a general purpose representation formalism that may be suitable for use in a number of different agent domains.

Statement of conformance

The following definitions of SL, and subsets SL0, SL1 and SL2 are *normative definitions* of these languages. That is, if a given agent chooses to implement a parser/interpreter for these languages, the following definitions must be adhered to. However, these languages are *informative suggestions* for the use of a content language: no agent is required as part of part 2 of this FIPA 97 specification to use the following content languages. However it should be noted that certain other parts of the FIPA 97 specification do make normative use of (some of) the following languages.

B.1B.1B.1 Grammar for SL concrete syntax

```

SLContentExpression      = SLWff
                          | SLIdentifyingExpression
                          | SLActionExpression.
SLWff                    = SLAtomicFormula
                          | "(" "not"           SLWff ")"
                          | "(" "and"          SLWff SLWff ")"
                          | "(" "or"           SLWff SLWff ")"

2068 **B.2B.2B.2** Notes on SL content language semantics

2069 This section contains explanatory notes on the intended semantics of the constructs introduced in §B.1 above.
 2070 **B.2.1B.2.1B.2.1** Grammar entry point: SL content expression

2071 An SL content expression may be used as the content of an ACL message. There are three cases:

2072 A proposition, which may be assigned a truth value in a given context. Precisely, it is a well-formed
 2073 formula using the rules described in SLWff. A proposition is used in the *inform* act, and other acts
 2074 derived from it.

2075 An action, which can be performed. An action may be a single action, or a composite action built
 2076 using the sequencing and alternative operators. An action is used as a content expression when the
 2077 act is the *request* act, and other CA's derived from it.

2078 An identifying reference expression (IRE), which identifies an object in the domain. This is the iota
 2079 operator, and is used in the *inform-ref* macro act and other acts derived from it.

2080 **B.2.2B.2.2B.2.2** SL Well-formed formula (SLWff)

2081 A well-formed formula is constructed from an atomic formula, whose meaning will be determined by the
 2082 semantics of the underlying domain representation, or recursively by applying one of the construction
 2083 operators or logical connectives described in the grammar rule. These are:

2084 (not <SLWff>)

2085 Negation. The truth value of this expression is false if *SLWff* is true. Otherwise it is true.

2086 (and <SLWff0> <SLWff1>)

2087 Conjunction. This expression is true iff well-formed formulae *SLWff0* and *SLWff1* are both true,
 2088 otherwise it is false.

2089 (or <SLWff0> <SLWff1>)

2090 Disjunction. This expression is false iff well-formed formulae *SLWff0* and *SLWff1* are both false,
 2091 otherwise it is true.

2092 (implies <SLWff0> <SLWff1>)

2093 Implication. This expression is true if either *SLWff0* is false, or alternatively if *SLWff0* is true and
 2094 *SLWff1* is true. Otherwise it is false. The expression corresponds to the standard material implication
 2095 connective:

2096 *SLWff0* *SLWff1*.

2097 (equiv <SLWff0> <SLWff1>)

2098 Equivalence. This expression is true if either *SLWff0* is true and *SLWff1* is true, or alternatively if
 2099 *SLWff0* is false and *SLWff1* is false. Otherwise it is false.

2100 (forall <variable> <SLWff>)

2101 Universal quantification. The quantified expression is true if *SLWff* is true for every value of value of
 2102 the quantified variable.

2103 (exists <variable> <SLWff>)

2104 Existential quantification. The quantified expression is true if there is at least one value for the
 2105 variable for which *SLWff* is true.

2106 (B <agent> <expression>)

2107 It is true that *agent* believes that *expression* is true.

2108 (U <agent> <expression>)

2109 It is true that *agent* is uncertain of the truth of *expression*. *Agent* neither believes *expression* nor its
 2110 negation, but believes that *expression* is more likely to be true than its negation.

2111 (I <agent> <expression>)
 2112 It is true that *agent* intends that *expression* becomes true, and will plan to bring it about.
 2113 (PG <agent> <expression>)
 2114 It is true that *agent* holds a persistent goal that *expression* becomes true, but will not necessarily plan
 2115 to bring it about.
 2116 (feasible <SLActionExpression> <SLWff>)
 2117 It is true that action *SLActionExpression* (or, equivalently, some event) can take place, and just
 2118 afterwards *SLWff* will be true.
 2119 (feasible <SLActionExpression>)
 2120 Same as (feasible <SLActionExpression> true).
 2121 (done <SLActionExpression> <SLWff>)
 2122 It is true that action *SLActionExpression* (or, equivalently, some event) has just taken place, and just
 2123 before that *SLWff* was true.
 2124 (done <SLActionExpression>)
 2125 Same as (done <SLActionExpression>, true)

B.2.3B.2.3B.2.3 SL Atomic Formula

2127 The atomic formula represents an expression which has a truth value in the language of the domain of
 2128 discourse. Three forms are defined: a given propositional symbol may be defined in the domain language,
 2129 which is either true or false; two terms may or may not be equal under the semantics of the domain language;
 2130 or some predicate is defined over a set of zero or more arguments, each of which is a term.
 2131 The SL representation does not define a meaning for the symbols in atomic formulae: this is the responsibility
 2132 of the domain language representation and ontology.

B.2.4B.2.4B.2.4 SL Term

2134 Terms are the arguments to predicates, and are either themselves atomic (constants and variables), or
 2135 recursively constructed as a functional term in which a functor is applied to zero or more arguments. Again,
 2136 SL only mandates a syntactic form for these terms. With small number of exceptions (see below), the
 2137 meanings of the symbols used to define the terms are determined by the underlying domain representation.
 2138 Note, as mentioned above, that no legal well-formed expression contains a free variable, that is, a variable not
 2139 declared in any scope within the expression. Scope introducing formulae are the quantifiers (*forall*, *exists*)
 2140 and the reference operator *iota*. Variables may only denote terms, not well-formed formulae.
 2141 The following special term is defined:

2142 (iota <variable> <term>)
 2143 The *iota* operator introduces a scope for the given *expression* (which denotes a term), in which the
 2144 given *identifier*, which would otherwise be free, is defined. An expression containing a free variable
 2145 is not a well-formed SL expression. The expression "(iota x (P x))" may be read as "the x such that P
 2146 [is true] of x. The *iota* operator is a constructor for terms which denote objects in the domain of
 2147 discourse.

B.2.5B.2.5B.2.5 Result predicate

2149 A common need is to determine the result of performing an action or evaluating a term. To facilitate this
 2150 operation, a standard predicate *result*, of arity two, is introduced to the language. Result/2 has the declarative
 2151 meaning that the result of evaluating the term, or equivalently of performing the action, encoded by the first
 2152 argument term, is the second argument term. However, it is expected that this declarative semantics will be
 2153 implemented in a more efficient, operational way in any given SL interpreter.
 2154 A typical use of the *result* predicate is with a variable scoped by *iota*, giving an expression whose meaning is,
 2155 for example, "the x which is the result of agent *i* performing *act*":

(iota x (result (action i act) x)))

B.2.6 ~~B.2.6~~ **B.2.6** Actions and action expressions

Action expressions are a special subset of terms. In particular, three functional term functors are reserved: "action", "/" and ";". An action itself is introduced by the keyword "action", and comprises the agent of the action (i.e. an identifier representing the agent performing the action) and a term denoting the action which is [to be] performed. An alternative form of action is precisely the ACL communicative act. For syntactic rules, see §~~06.4~~ ~~Message syntax~~ ~~6.4~~ ~~Message syntax~~.

Two operators are used to build terms denoting composite acts:

the sequencing operator ";" denotes a composite act in which the first action (the represented by the first operand) is followed by the second action;

the alternative operator "|" denotes a composite act in which either the first action occurs, or the second, but not both.

B.2.7 ~~B.2.7~~ **B.2.7** Agent identifier

An agent is represented by referring to its name. The name is defined using the standard format from part one of this specification, which is repeated in §~~16.13~~ ~~13~~

B.2.8 ~~B.2.8~~ **B.2.8** Numerical Constants

Due to the necessarily unpredictable nature of cross-platform dependencies, agents should not make strong assumptions about the precision with which another agent is able to represent a given numerical value. SL assumes only 32 bit representations of both integers and floating point numbers. Agents should not exchange message contents containing numerical values requiring more than 32 bits to encode precisely, unless some prior arrangement is made to ensure that this is valid.

B.3 ~~B.3~~ **B.3** Reduced expressivity subsets of SL

The SL definition given above is a very expressive language, but for some agent communication tasks it is unnecessarily powerful. This expressive power has an implementation cost to the agent, and introduces problems of the decidability of modal logic. To allow simpler agents, or agents performing simple tasks to do so with minimal computational burden, this section introduces semantic and syntactic subsets of the full SL language for use by the agent when it is appropriate or desirable to do so. These subsets are defined by the use of *profiles*, that is, statements of restriction over the full expressiveness of SL. These profiles are defined in increasing order of expressiveness as SL₀, SL₁ and SL₂.

Note that these subsets of SL, with additional ontological commitments (i.e. the definition of domain predicates and constants) are used in other parts of the FIPA 97 specification.

B.3.1 ~~B.3.1~~ **B.3.1** SL₀: minimal subset of SL

Profile 0 is denoted by the normative constant SL₀ in the :language parameter of an ACL message.

Profile 0 of SL is the minimal subset of the SL content language. It allows the representation of actions, the determination of the result a term representing a computation, the completion of an action and simple binary propositions.

The following defines the SL₀ grammar:

```
SL0ContentExpression = SL0Wff
                    | SL0ActionExpression.
```

```
SL0Wff = SL0AtomicFormula
        | "(" SL0ActionOp SL0ActionExpression ")".
```

```

2199 SL0AtomicFormula      = SLPropositionSymbol
2200 | "(" "result" SL0Term SL0Term ")"
2201 | "(" SL0PredicateSymbol SL0Term* ")"
2202 | "true"
2203 | "false".
2204
2205 SL0ActionOp            = "done".
2206
2207 SL0Term                 = SLVariable
2208 | SLConstant
2209 | SL0FunctionalTerm
2210 | SL0ActionExpression.
2211
2212 SL0ActionExpression    = "(" "action" SLAgent SL0FunctionalTerm ")"
2213 | ACLCommunicativeAct.
2214 SL0FunctionalTerm      = "(" SLFunctionSymbol SL0Term* ")"
2215

```

B.3.2B.3.2B.3.2 SL1: propositional form

```

2217 Profile 1 is denoted by the normative constant SL1 in the :language parameter of an ACL message.
2218 Profile 1 of SL extends the minimal representational form of SL0 by adding Boolean connectives to represent
2219 propositional expressions.
2220 The following defines the SL1 grammar:
2221 SL1ContentExpression   = SL1Wff
2222 | SL1ActionExpression.
2223
2224 SL1Wff                 = SL1AtomicFormula
2225 | "(" "not"           SL1Wff ")"
2226 | "(" "and"           SL1Wff SL1Wff ")"
2227 | "(" "or"            SL1Wff SL1Wff ")"
2228 | "(" SL1ActionOp    SL1ActionExpression ")".
2229
2230 SL1AtomicFormula      = SLPropositionSymbol
2231 | "(" "result" SL1Term SL1Term ")"
2232 | "(" SL1PredicateSymbol SL1Term* ")"
2233 | "true"
2234 | "false".
2235
2236 SL1ActionOp           = "done".
2237
2238 SL1Term                = SLVariable
2239 | SLConstant
2240 | SL1FunctionalTerm
2241 | SL1ActionExpression.
2242
2243 SL1ActionExpression   = "(" "action" SLAgent SL1FunctionalTerm ")"
2244 | ACLCommunicativeAct.
2245
2246
2247 SL1FunctionalTerm     = "(" SLFunctionSymbol SL1Term* ")".
2248

```

2249 **B.3.3B.3.3 SL2: restrictions for decidability**

2250 Profile 2 is denoted by the normative constant SL2 in the : language parameter.

2251 Profile 2 of SL is a subset of the SL content language which still allows first order predicate and modal logic,
 2252 but is restricted to ensure that it is decidable. Well-known effective algorithms exist (for instance KSAT and
 2253 Monadic [references? –ed]) that can derive whether or not an SL2 wff is a logical consequence of a set of
 2254 wffs.

2255 The following defines the SL2 grammar:

```

2256 SL2ContentExpression = SL2Wff
2257 | SL2QuantifiedExpression
2258 | SL2IdentifyingExpression
2259 | SL2ActionExpression.
2260
2261 SL2Wff = SL2AtomicFormula
2262 | "(" "not" SL2Wff ")"
2263 | "(" "and" SL2Wff SL2Wff ")"
2264 | "(" "or" SL2Wff SL2Wff ")"
2265 | "(" "implies" SL2Wff SL2Wff ")"
2266 | "(" "equiv" SL2Wff SL2Wff ")"
2267 | "(" SLModalOp SLAgent SL2QuantifiedExpression
2268 " )"
2269 | "(" SLActionOp SL2ActionExpression ")"
2270 | "(" SLActionOp SL2ActionExpression
2271 SL2UnivExistQuantWff ")".
2272
2273 SL2AtomicFormula = SLPropositionSymbol
2274 | "(" "=" SL2Term SL2Term ")"
2275 | "(" "result" SL2Term SL2Term ")"
2276 | "(" SLPredicateSymbol SL2Term* ")"
2277 | "true"
2278 | "false".
2279
2280 SL2QuantifiedExpression = SL2UnivQuantExpression
2281 | SL2ExistQuantExpression
2282 | SL2Wff.
2283
2284 SL2UnivQuantExpression = "(" "forall" SL2variable SL2Wff ")"
2285 | "(" "forall" SL2variable SL2UnivQuantExpression
2286 " )".
2287 | "(" "forall" SL2variable
2288 SL2ExistQuantExpression " )".
2289
2290 SL2ExistQuantExpression = "(" "exists" SL2variable SL2Wff ")"
2291 | "(" "exists" SL2variable SL2ExistQuantExpression
2292 " )"
2293
2294 SL2Term = SLVariable
2295 | SLConstant
2296 | SL2FunctionalTerm
2297 | SL2ActionExpression
2298 | SL2IdentifyingExpression.
2299

```

```

2300 SL2IdentifyingExpression = "(" "iota" SLVariable SL2Wff ")"
2301
2302 SL2FunctionalTerm        = "(" SLFunctionSymbol SL2Term* ")"
2303
2304 SL2ActionExpression      = "(" "action" SLAgent SL2FunctionalTerm ")"
2305 | ACLCommunicativeAct
2306 | "(" "|" SL2ActionExpression SL2ActionExpression
2307 | ")"
2308 | "(" ";" SL2ActionExpression SL2ActionExpression
2309 | ")"
2310

```

2311 That is the SL2Wff production no longer directly contains the logical quantifiers, but these are treated
 2312 separately to ensure only prefixed quantified formulas, such as:

```

2313   (forall ?x1 (forall ?x2
2314     (exists ?y1 (exists ?y2
2315       (Phi ?x1 ?x2 ?y1 ?y2) )) ))

```

2316 where (Phi ?x1 ?x2 ?y1 ?y2) does not contain any quantifier.

2317 The grammar of SL2 still allows for *quantifying-in* inside modal operators. E.g. the following formula is still
 2318 admissible under the grammar:

```

2319   (forall ?x1
2320     (or
2321       (B i (p ?x1))
2322       (B j (q ?x1) ))

```

2323 It is not clear that formulae of this kind are decidable. However, changing the grammar to express this
 2324 context sensitivity would make the EBNF form above essentially unreadable. Thus the following additional
 2325 mandatory constraint is placed on well-formed content expressions using SL2:

2326 **Within the scope of an SLModalOperator only closed formulas are allowed, i.e. formulas without free**
 2327 **variables.**

2328

(informative)

Relationship of ACL to KQML

This annex outlines some of the primary similarities and differences between FIPA ACL and the *de facto* standard agent communication language KQML (Knowledge Querying and Communication Language) [Finin et al 97]. The intention of this appendix is not to deliver a complete characterisation of KQML (which is an evolving language in itself anyway) and the differences between it and ACL, but simply to outline some key areas of difference as an aide to readers already familiar with KQML.

~~C.1.C.1.C.1~~ Primary similarities and differences

Both KQML and ACL are interlingua languages, intended to provide a common linguistic basis for independent agents to communicate with each other. Both languages are based on speech act theory, which states that individual communications can be reduced to one of a small number of primitive *speech*, or more generally, *communicative* acts, which shape the basic meaning of that communication. The full meaning is conveyed by the meaning that the speech act itself imparts to the content of the communication. In KQML, the speech act is called the *performative*, though it should be noted that some researchers prefer other terms. Syntactically, KQML sets out to be simple to parse and generate, yet easily human readable. To this end, KQML's syntax is Lisp based (Lisp sharing similar syntactic goals, as well as being an early implementation vehicle for KQML): each message is an s-expression and uses a core of Lisp-like tokenising rules. Some extensions are added to allow for the encoding of content in arbitrary other notations. FIPA ACL adopts a very similar syntax, including the form of messages and message parameters. Some differences exist in the names of both the message type keywords and the parameter keywords. Both languages can be challenged in the compactness of their encoding; ACL explicitly notes that future revisions may include one or more alternative transport syntaxes optimised for message compactness.

KQML was designed originally to fulfil a very pragmatic purpose as part of the Knowledge Sharing Effort (KSE) consortium. Initially, the semantics of the performatives were described informally by natural language descriptions. Subsequent research has addressed the need for a more precise semantics [Labrou 96], though it is not clear that the proposed semantics has been universally adopted. Indeed, several flavours of KQML are extant. ACL is derived from the research work of Sadek et al [Sadek et al '95], and was designed from its inception to be grounded in a formally defined semantics.

KQML aims to serve several needs in inter-agent communication. These can be summarised as:

- querying and information passing (e.g. evaluate, ask-if, tell, achieve, etc)
- managing multiple responses to queries (e.g. ask-all, stream-all, standby, ready, next, etc)
- managing capability definition and dissemination (advertise, recommend, etc)
- managing communications (e.g. register, forward, broadcast, etc)

That these are all needs that must be addressed in inter-agent communication (in the general case, at least) is clear. KQML attempts to define a core set of performatives that together meet all of these needs, while balancing a desire for parsimony in the language. ACL does not attempt to cover all of these needs within the language. Instead, some categories are explicitly devolved to the agent management system (see part 1 of the FIPA 97 specification) or are the responsibility of the content language (notably managing multiple responses to queries).

2369 **C.2.2C.2 Correspondence between KQML message performatives and FIPA CA's**

2370 This section outlines some specific categories of KQML messages and the (approximately) equivalent
 2371 constructs in the ACL and other sections of the FIPA specification.

2372 **C.2.1C.2.1C.2.1 Agent management primitives**

2373 Some of the message types included in KQML can not be considered speech acts in the traditional sense, but
 2374 do have a useful role to play in mediating conversations between agents and providing capabilities to manage
 2375 an agent society. This specification adopts the position that, despite the arguable increase in complexity, it is
 2376 better to clearly separate such concerns from the core communication primitives. Thus, equivalents to the
 2377 following KQML messages are not directly included in the ACL specification:

2378 register
 2379 unregister
 2380 recommend (-one, -all)
 2381 recruit (-one, -all)
 2382 broker (-one, -all)
 2383 advertise

2384 Instead, effects similar or equivalent to these messages can be obtained by embedding the agent management
 2385 primitives defined in part one of the FIPA 97 specification, embedded in an ACL *request* act addressed to the
 2386 appropriate facilitator agent.

2387 **C.2.2C.2.2C.2.2 Communications management**

2388 Similarly, the following KQML performatives find their equivalents in the FIPA specification as agent
 2389 management actions, communicated via a *request* act:

2390 broadcast
 2391 transport-address
 2392 forward

2393 In the last case, *forward* is one solution to the problem of sending a message to an agent whose agent
 2394 identifier or network transport address are not known at the time of sending the message. In the semantics of
 2395 KQML, each intermediary does not interpret the message embedded within the *forward* performative, and
 2396 thus does not perform any action implied by it. This capability does exist in the FIPA specification using the
 2397 agent management capabilities defined in part one of this specification.

2398 **C.2.3C.2.3C.2.3 Managing multiple solutions**

2399 There is frequently a need to convey more than one answer to an enquiry. This may be because the query was
 2400 under-constrained, or may be due to the nature of the application, e.g. selecting records from a database.
 2401 KQML provides a number of mechanisms for handling multiple queries at the message level:

2402 sender asks replier to send any solution (ask-one)
 2403 sender asks replier to send all solutions (ask-all)
 2404 sender asks replier to send all solutions, each one in its own message (stream-all) and then to demark
 2405 the end of the solution stream (eos)
 2406 sender asks replier to set up a solution generator; a protocol then exists to test, acces and destroy the
 2407 generator (standby, ready, next, rest, discard).

2408 Although enquiring is a general and very useful category of speech acts, these performatives suffer from
 2409 being complicated by assumptions about the representational form of the content of the reply. ACL takes the
 2410 position that the requirement for managing multiple solutions is properly the remit of the content language.
 2411 For example, if an application requires a solution generator, of the kind implied by KQML standby, etc, such

2412 a construct should be a part of domain content language. Operations on the generator object would then be
 2413 the subject of generic *request* acts.

2414 [C.2.4](#)~~C.2.4~~ **C.2.4 Other discourse performatives**

2415 The following discusses the remaining performatives in the core KQML specification. Note that statements of
 2416 equivalence in the following list are advisory only, since there is no universally accepted KQML formal
 2417 semantics to check against ACL semantics for equivalence.

2418 *ask-if*: nearest equivalent in ACL is *query-if*

2419 *tell*: equivalent to ACL's $\langle i, \text{inform}(j, B_i p) \rangle$

2420 *untell*: equivalent to $\langle i, \text{inform}(j, \neg B_i p) \rangle$

2421 *deny*: equivalent to $\langle i, \text{inform}(j, \neg B_i p) \rangle$ or $\langle i, \text{disconfirm}(j, p) \rangle$

2422 *insert, uninsert*: these performatives are not supported in ACL, since an agent is not given the power
 2423 to directly manipulate the beliefs of another agent. Use *inform* and *disconfirm* instead.

2424 *delete-(one, all), undelete*: these performatives are not supported in ACL, since an agent is not given
 2425 the power to directly manipulate the beliefs of another agent.

2426 *achieve*: goals can be communicated among agents through the use of an achieve domain-language
 2427 primitive, if that is appropriate to the domain (see §[A.1.4A.1.4A.1.4A.1.4](#))

2428 *unachieve*: KQML's unachieve is a kind of undo action: the recipient is asked to return the world (or
 2429 at least, that part it has control over) to the state it was in before the corresponding achieve. There is
 2430 no equivalent to this action in ACL. If a given domain is able to support such an action (e.g. the
 2431 domain of text editing), specific actions may be defined in the domain ontology to support undo
 2432 actions.

2433 *subscribe*: equivalent to the *subscribe* in ACL

2434 *error*: use *not-understood*

2435 *sorry*: use *refuse* or *failure*.

2436

~~Annex D~~
Annex D
 (informative)

MIME-encoding to extend content descriptions

This Annex provides a means for agents to extend the representational capability of a given message content by using MIME style content description and encoding.

D.1D.1 Extension of FIPA ACL to include MIME headers

The MIME enhancements extend the grammar shown in §~~06.4~~ Message syntax~~6.4~~ Message syntax as follows:

```

MIMEEnhancedExpression      = Word
                              | String
                              | Number
                              | MIMEEncapsulatedExpression
                              | "(" MIMEEnhancedExpression * ")".

MIMEEncapsulatedExpression = "(" MIMEVersionField
                              MIMEOptionalHeader *
                              MIMEEnhancedExpression
                              ")".

MIMEVersionField            = "(" "MIME-
Version 1.0 (FIPA ACL Message)" ")".

MIMEOptionalHeader         = "(" "Content-type:" MIME_CT_Expression ")"
                              | "(" "Content-Transfer-
Encoding:" MIME_CTE_Expression ")"
                              | "(" "Content-ID:" MIME_CID_Expression ")"
                              | "(" "Content-
Description:" MIME_CD_Expression ")"
                              | "(" MIME_Additional_CF ")".

MIME_CT_Expression         = see RFC2045.
MIME_CTE_Expression        = see RFC2045.
MIME_CID_Expression        = see RFC2045.
MIME_CD_Expression         = see RFC2045.
MIME_Additional_CF         = see RFC2045.

```

As shown here, the grammar is not complete. However, rather than duplicate the full syntax from RFC2045, and risk introducing errors or failing to keep track of changes in that specification, this document refers the reader to [Freed & Borenstein 96].

Note that the MIME headers have been introduced in such a way that they do not alter the basic s-expression form of the ACL content expression. The MIME grammar presented here is a sub-grammar of the ACL s-expression grammar.

2478 **D.2D.2D.2 Example**

2479 The following example illustrates the use of MIME-style encoding of message content:

```

2480 (inform
2481     :sender translator
2482     :receiver agent01
2483     :content (translation
2484               (English "File system full")
2485               (Japanese ((MIME-Version: 1.0 (FIPA ACL Message))
2486                          (Content-Type: Text/Plain; Charset=ISO-
2487 2022-JP)
2488                          (Content-Transfer-Encoding: 7BIT)
2489                          "<7 bit ISO 2022 Japanese text>")
2490               )
2491     ))
2492 :ontology translation-service
2493 :in-reply-to request07)
2494
```
