#### Notice

Use of the technologies described in this specification may infringe patents, copyrights or other intellectual property rights of FIPA Members and non-members. Nothing in this specification should be construed as granting permission to use any of the technologies described. Anyone planning to make use of technology covered by the intellectual property rights of others should first obtain permission from the holder(s) of the rights. FIPA strongly encourages anyone implementing any part of this specification to determine first whether part(s) sought to be implemented are covered by the intellectual property of others, and, if so, to obtain appropriate licenses or other permission from the holder(s) of such intellectual property prior to implementation. This specification is subject to change without notice. Neither FIPA nor any of its Members accept any responsibility whatsoever for damages or liability, direct or consequential, which may result from the use of this specification.

#### 21 Foreword

The Foundation for Intelligent Physical Agents (FIPA) is an international organization that is dedicated to promoting the industry of intelligent agents by openly developing specifications supporting interoperability among agents and agentbased applications. This occurs through open collaboration among its member organizations, which are companies and universities that are active in the field of agents. FIPA makes the results of its activities available to all interested parties and intends to contribute its results to the appropriate formal standards bodies where appropriate.

The members of FIPA are individually and collectively committed to open competition in the development of agentbased applications, services and equipment. Membership in FIPA is open to any corporation and individual firm, partnership, governmental body or international organization without restriction. In particular, members are not bound to implement or use specific agent-based standards, recommendations and FIPA specifications by virtue of their participation in FIPA.

The FIPA specifications are developed through direct involvement of the FIPA membership. The status of a specification can be either Preliminary, Experimental, Standard, Deprecated or Obsolete. More detail about the process of specification may be found in the FIPA Document Policy [f-out-00000] and the FIPA Specifications Policy [f-out-00003]. A complete overview of the FIPA specifications and their current status may be found on the FIPA Web site.

FIPA is a non-profit association registered in Geneva, Switzerland. As of June 2002, the 56 members of FIPA represented many countries worldwide. Further information about FIPA as an organization, membership information, FIPA specifications and upcoming meetings may be found on the FIPA Web site at http://www.fipa.org/.

## 50 **1 Scope**

51 This document deals with message transportation between inter-operating agents and also forms part of the FIPA 52 Agent Management Specification [FIPA00023]. It contains specifications for:

53 54

• Syntactic representation of ACL in string form.

# 56 2 String ACL Representation

57 This section defines the message transport syntax for string representation which is expressed in standard EBNF 58 format (see *Table 1*).

59

60 61

62

65

67

Grammar rule component	Example
Terminal tokens are enclosed in double quotes	п (п
Non-terminals are written as capitalised identifiers	Expression
Square brackets denote an optional construct	[ "," OptionalArg ]
Vertical bars denote an alternative between choices	Integer   Float
Asterisk denotes zero or more repetitions of the preceding expression	Digit*
Plus denotes one or more repetitions of the preceding expression	Alpha+
Parentheses are used to group expansions	( A   B )*
Productions are written with the non-terminal name on the left-hand side,	ANonTerminal = "terminal".
expansion on the right-hand side and terminated by a full stop

114			200	

#### 2.3 Lexical Rules

Some slightly different rules apply for the generation of lexical tokens<sup>2</sup>. Lexical tokens use the same notation as above, with the exceptions noted in Table 2. 

	Lexical rule component		Example			
	Square brackets enclose a cha	aracter set	[ "a", "b", "c" ]			
	Dash in a character set denote	es a range	[ "a" - "z" ]			
	Tilde denotes the complement	of a character set if it is the first character	[ ~ "(", ")" ]			
	Post-fix question-mark operato	or denotes that the preceding lexical	[ "0" – "9" ] ? [ "0" – "9" ]			
	expression is optional (may ap	pear zero or one times)				
9 0		Table 2: Lexical Rules				
1 2 3 ₄	Word	$= [\sim " \setminus 0 \times 00" - " \setminus 0 \times 20", "(", ")", [\sim " \setminus 0 \times 00" - " \setminus 0 \times 20", "(", ")"]$	, "#", "0" - "9", "-", "@"] ]*.			
	String	= StringLiteral   ByteLengthEncod	ledString.			
	StringLiteral = "\"" ([ ~ "\"" ]   "\\\"")* "\"".					
	ByteLengthEncodedString	= "#" Digit+ "\"" <byte sequence=""></byte>	>.			
	Number	= Integer   Float.				
	URL	= See [RFC2396]				
	DateTimeToken	<pre>= Sign? Year Month Day "T" Hour Minute Second MilliSecond ( TypeDesignator ? ).</pre>	1			
	Year	= Digit Digit Digit Digit.				
	Month	= Digit Digit.				
	Day	= Digit Digit.				
	Hour	= Digit Digit.				
	Minute	= Digit Digit.				

<sup>&</sup>lt;sup>2</sup> All white space, tabs, carriage returns and line feeds between tokens should be skipped by the lexical analyser.

#### 176 2.4 Representation of Time

Time tokens are based on [ISO8601], with extension for relative time and millisecond durations. Time expressions may
be absolute, or relative. Relative times are distinguished by the sign character + or - appearing as the first character in
the token. If no type designator is given, the local time zone is then used. The type designator for UTC is the character
2; UTC is preferred to prevent time zone ambiguities. Note that years must be encoded in four digits. As an example,
8:30 am on 15th April, 1996 local time would be encoded as:

- **182 183** 19960415T083000000
- 184

188

- 185 The same time in UTC would be:
- **186 187** 19960415T083000000Z
- 189 while one hour, 15 minutes and 35 milliseconds from now would be:
- **190 191** +0000000T011500035
- 192

195

197

#### 193 **2.5 Notes on the Grammar Rules**

- 194 1. The standard definitions for integers and floating point are assumed.
- 196 2. All keywords are case-insensitive.

A length encoded string is a context sensitive lexical token. Its meaning is as follows: the message envelope of the token is everything from the leading # to the separator " (inclusive). Between the markers of the message envelope is a decimal number with at least one digit. This digit then determines that *exactly* that number of 8-bit bytes are to be consumed as part of the token, without restriction. It is a lexical error for less than that number of bytes to be available.

- Note that not all implementations of the ACC (see [FIPA00067]) will support the transparent transmission of 8-bit characters. It is the responsibility of the agent to ensure, by reference to internal API of the ACC, that a given channel is able to faithfully transmit the chosen message encoding.
- A well-formed message will obey the grammar, and in addition, will have at most one of each of the parameters. It
   is an error to attempt to send a message which is not well formed. Further rules on well-formed messages may be
   stated or implied the operational definitions of the values of parameters as these are further developed.
- 211 212 6. Strings encoded in accordance with [ISO2022] may contain characters which are otherwise not permitted in the 213 definition of Word. These characters are ESC ( $0 \times 1B$ ), SO ( $0 \times 0E$ ) and SI ( $0 \times 0F$ ). This is due to the complexity that 214 would result from including the full [ISO2022] grammar in the above EBNF description. Hence, despite the basic 215 description above, a word may contain any well-formed [ISO2022] encoded character, other (representations of) 216 parentheses, spaces, or the # character. Note that parentheses may legitimately occur as part of a well formed 217 escape sequence; the preceding restriction on characters in a word refers only to the encoded characters, not the 218 form of the encoding.
- 220 7. The format for time tokens is defined in Section 2.4.
- 222 8. The format for an AID is defined in [FIPA00023].
- 223
