### Notice

Use of the technologies described in this specification may infringe patents, copyrights or other intellectual property rights of FIPA Members and non-members. Nothing in this specification should be construed as granting permission to use any of the technologies described. Anyone planning to make use of technology covered by the intellectual property rights of others should first obtain permission from the holder(s) of the rights. FIPA strongly encourages anyone implementing any part of this specification to determine first whether part(s) sought to be implemented are covered by the intellectual property of others, and, if so, to obtain appropriate licenses or other permission from the holder(s) of such intellectual property prior to implementation. This specification is subject to change without notice. Neither FIPA nor any of its Members accept any responsibility whatsoever for damages or liability, direct or consequential, which may result from the use of this specification.

## 21 **Foreword**

22 The Foundation for Intelligent Physical Agents (FIPA) is an international organization that is dedicated to promoting the  
23 industry of intelligent agents by openly developing specifications supporting interoperability among agents and agent-  
24 based applications. This occurs through open collaboration among its member organizations, which are companies and  
25 universities that are active in the field of agents. FIPA makes the results of its activities available to all interested parties  
26 and intends to contribute its results to the appropriate formal standards bodies where appropriate.

27 The members of FIPA are individually and collectively committed to open competition in the development of agent-  
28 based applications, services and equipment. Membership in FIPA is open to any corporation and individual firm,  
29 partnership, governmental body or international organization without restriction. In particular, members are not bound to  
30 implement or use specific agent-based standards, recommendations and FIPA specifications by virtue of their  
31 participation in FIPA.

32 The FIPA specifications are developed through direct involvement of the FIPA membership. The status of a  
33 specification can be either Preliminary, Experimental, Standard, Deprecated or Obsolete. More detail about the process  
34 of specification may be found in the FIPA Document Policy [f-out-00000] and the FIPA Specifications Policy [f-out-  
35 00003]. A complete overview of the FIPA specifications and their current status may be found on the FIPA Web site.

36 FIPA is a non-profit association registered in Geneva, Switzerland. As of June 2002, the 56 members of FIPA  
37 represented many countries worldwide. Further information about FIPA as an organization, membership information,  
38 FIPA specifications and upcoming meetings may be found on the FIPA Web site at <http://www.fipa.org/>.

50 **1 Scope**

51 This document deals with message transportation between inter-operating agents and also forms part of the FIPA  
52 Agent Management Specification [FIPA00023]. It contains specifications for:

53

- 54 • The transport of messages between agents using the Internet Inter-Orb Protocol (IIOP - see [OMGiop]).

55

## 56 2 Message Transport Protocol for IIOP

57 This MTP is based on the transfer of an OMG IDL structure containing the message envelope and an octet sequence  
58 representing the ACL message body. The envelope and the message body are transferred together within a single IIOP  
59 one-way invocation [OMGiop].

60

61 Once the request has been received, the message envelope is used by the ACC to obtain the instructions and  
62 information needed to correctly handle the message body.

63

### 64 2.1 Component Name

65 The name assigned to this component is:

66

67 `fipa.mts.mtp.iiop.std`

68

### 69 2.2 Interface Definition

70 The following IDL specifies the message transport interface. This interface contains a single operation `message()` that  
71 requires a single argument. This argument has two attributes: a sequence of `Envelope` structures holding the  
72 message envelope and the payload, that is a sequence of octets containing the ACL message body.

73

```
74 module FIPA {
75     typedef sequence<Envelope> Envelopes;
76     typedef sequence<octet> Payload;
77     struct FipaMessage {
78         Envelopes messageEnvelopes;
79         Payload    messageBody;
80     };
81
82     interface MTS {
83         oneway void message(in FipaMessage aFipaMessage);
84     };
85 };
86
```

### 87 2.3 ACC Processing of IDL Envelope

88 According to [FIPA00067], a FIPA compliant ACC is not allowed to modify any element of the envelope that it receives.  
89 It is however allowed to update a value in one of the envelope parameters by adding a new `Envelope` element at the  
90 end of the `messageEnvelopes` sequence. This new element is required to have only those parameter values that the  
91 ACC wishes to add or update plus a new `ReceivedObject` element as mandated in [FIPA00067].

92

93 As a consequence, an ACC that receives a message must implement the procedure described in the following pseudo-  
94 code. The procedure recomposes the full envelope structure with its latest values for each parameter. The procedure  
95 simply shows that the ACC starts from the last envelope in the sequence and continues until it has all the required  
96 values for each parameter of the envelope.

97

```
98 EnvelopeWithAllFields := new empty Envelope;
```

99

```
100 while ((EnvelopeWithAllFields does not contain values for all its fields)
101         OR (all Envelopes in the sequence have been processed)) {
102     // the ACC gets the next envelope in the sequence starting from the end
103     tempEnvelope = getNextEnvelope;
104
105     foreach field in an envelope {
106         if ((this field has no value in envelopeWithAllFields)
107             AND (this field has a value in tempEnvelope))
108         then copy the value of this field from tempEnvelope to envelopeWithAllFields
```

```

109     }
110 }
111
112 EnvelopeWithAllFields now contains the latest values for all its fields.
113
114 For example:
115
116 Envelope(0):
117   to = tizio
118   from = caio
119   aclRepresentation = XML
120   received = ...
121
122 Envelope (1):
123   from = caio@molfetta.it
124   received = ...
125
126 Envelope (2):
127   intended-receiver = tizio@villardora.it
128   received = ...
129
130 EnvelopeWithAllFields:
131   to = tizio                                (from envelope 0)
132   from = caio@molfetta.it                  (from envelope 1)
133   intended-receiver = tizio@villardora.it  (from envelope 2)
134   date = 25 May 2000                       (from envelope 0)
135

```

## 136 2.4 Concrete Message Envelope Syntax

137 The abstract envelope syntax from [FIPA00067] maps into a set of OMG IDL structured types, all of which are enclosed  
 138 within the FIPA module.

139  
 140 The following standard convention applies for the identification of optional parameters: an empty string and an empty  
 141 sequence identify the non-presence of a parameter. In the case of the `payload-length` parameter (which is a  
 142 number) any negative value can be used to identify the non-presence of the parameter.

143  
 144 The complete IDL definition is:

```

145
146 module FIPA {
147   // No need for an URL struct, since it's only put in the
148   // message envelope for informational purposes.
149   typedef string URL;
150
151
152   // this generic type is used to represent user-defined, non FIPA-defined,
153   // properties that are added to the message envelope in the form of a
154   // keyword and value pair.
155   struct Property {
156     string keyword;
157     any value;
158   };
159
160   struct AgentID { // Agent Identifier
161     string name;
162     sequence<URL> addresses;
163     sequence<AgentID> resolvers;
164     sequence<Property> userDefinedProperties;
165   };
166
167   typedef sequence<AgentID> AgentIDs; // sequence of Agent Identifiers
168

```

```

169 // IDL struct to represent a time stamp.
170 // It is based on the ISO8601 format with extension for millisecond durations.
171 // The value of the typeDesignator must be a valid
172 // AlphaCharacter, i.e. ['a'-'z' , 'A'-'Z'], that identifies the timezone.
173 // ISO8601 reports the mapping between typeDesignator and timezone.
174 // The typeDesignator for UTC is the character 'Z'.
175 // If the value of typeDesignator is not an AlphaCharacter, it defaults
176 // to the local timezone.
177 struct DateTime {
178     short year;           // year (e.g. 2000)
179     short month;         // between 1 and 12
180     short day;           // between 1 and 31
181     short hour;          // between 0 and 23
182     short minutes;       // between 0 and 59
183     short seconds;       // between 0 and 59
184     short milliseconds; // between 0 and 999
185     char typeDesignator; // see comment above
186 };
187
188 struct ReceivedObject {
189     URL by;
190     URL from;
191     DateTime date;
192     string id;
193     string via;
194 };
195
196 typedef sequence<Property> TransportBehaviourType;
197 typedef sequence<AgentID,1> OptAgentID;
198 typedef sequence<DateTime,1> OptDateTime;
199 typedef sequence<TransportBehaviourType,1> OptTransportBehaviourType;
200 typedef sequence<ReceivedObject,1> OptReceivedObject;
201
202 struct Envelope {
203     AgentIDs to;
204     OptAgentID from;
205     string comments;
206     string aclRepresentation;
207     long payloadLength;
208     string payloadEncoding;
209     OptDateTime date;
210     AgentIDs intendedReceiver;
211     OptReceivedObject received;
212     OptTransportBehaviourType transportBehaviour;
213     sequence<Property> userDefinedProperties; // user-defined properties
214 };
215
216 typedef sequence<Envelope> Envelopes;
217 typedef sequence<octet> Payload;
218
219 struct FipaMessage {
220     Envelopes messageEnvelopes;
221     Payload messageBody;
222 };
223
224 interface MTS {
225     oneway void message(in FipaMessage aFipaMessage);
226 };
227 };
228

```

## 240 4 Informative Annex A — URL Schemes for IIOp Addresses

241 Section 3.6 of OMG Naming Service specifications [OMGnam] and section 13.6 of OMG ORB Interoperability  
242 Architecture [OMGint] describe the Uniform Resource Locator (URL) schemes available to represent a CORBA object  
243 or a CORBA object bound in a Naming Service and that can be used within FIPA to represent valid IIOp addresses:  
244

- 245 • `IOR`. The string form of an IOR (`IOR:<hex_octets>`) is a valid URL. The scheme name is **IOR** and the text  
246 after the `:` is defined in the CORBA 2.3 specification, Section 13.6.6. The IOR URL is robust and insulates the client  
247 from the encapsulated transport information and object key used to reference the object. This URL format is  
248 independent of Naming Service.  
249
- 250 • `corbaloc`. It is difficult for humans to exchange IORs through non-electronic means because of their length and  
251 the text encoding of binary information. The `corbaloc` URL scheme provides URLs that are familiar to people and  
252 similar to `ftp` or `http` URLs. The `corbaloc` URL is described in the CORBA 2.3 Specification, Section 13.6.6. This  
253 URL format is independent of the Naming Service.  
254
- 255 • `corbaname`. A `corbaname` URL is similar to a `corbaloc` URL. However a `corbaname` URL also contains a  
256 stringified name that identifies a binding in a naming context.  
257

258 Refer to the OMG specs for how to use a CORBA Naming Resolution Service and for the complete syntax of the used  
259 URL schemes.
